Childhood Trauma Questionnaire (CTQ)

Description

The Childhood Trauma Questionnaire (CTQ) is a self-report instrument covering 28 items, to rate the severity of emotional abuse and neglect, physical abuse and neglect and sexual abuse. It has been validated in terms of psychometric test properties in samples of psychiatric patients, i.e. drug and substance abusers. [Bernstein 1994] This data set includes five CTQ subscale scores.

Refer to the data codebook for the detailed information of each variable.

Study Sample

223 participants

Data Collection Methods

CTQ were administered on the second clinic evaluation day. The scores were derived from the raw responses.
