It seems that only residents of Endicott and those that worked in building are included in this study. there were other areas that had the same and more chemicals. those areas were building 5 and dept 036 Building 5 was an old building of wood and small. the wet process area had a haze in it at times from the chemicals.

The expose and develop room was an 8 x 10 room. This room being so small had vapors in it at all times and those working in there would breathe the vapors in all the time. That also goes for the cleaning tanks on the wet line.

In building 36 the cleaning and etching and plating lines had old equipment.
