Centers for Disease Control and Prevention

Regarding: National Firefighter Registry for Cancer

Dr. Fent,

On behalf of Women in Fire, I would like to express our support for the National Firefighter Registry (NFR) for Cancer. With cancer being the number one killer in today's fire service, the work you and your colleagues are doing is an amazing and large endeavor. It is important that organizations such as our own support your efforts and share the resources to our members and to the fire service.

The data being collected from the National Firefighter Registry for Cancer will provide life-saving information for early detection, more effective treatments, and to help prevent future cancer exposures. This data-driven evidence is necessary for researchers, clinicians, policy makers, and organizations that set the standards for the fire service. It is only through a group effort that we will be able to reduce cancer risks among firefighters.

On behalf of Women in Fire, I share our continued support for the National Firefighter Registry for Cancer.

Sincerely,

Toni Washington
President

Empowering uniqueness and unity.
