Introduction to the ABES

Introduction

The Adolescent Behaviors and Experiences Survey (ABES) was conducted by the Centers for Disease Control and Prevention (CDC) during the spring of 2021 to provide nationally representative data during a time when many students were attending school virtually due to the Coronavirus Disease 2019 (COVID-19) pandemic. The online questionnaire was designed to collect information on health-related experiences and behaviors among high school students. These experiences and behaviors include

- COVID-19 related experiences.
- Emotional well-being.
- Experiences related to perceived racism.
- Behaviors that contribute to violence and unintentional injuries.
- Sexual behaviors that contribute to unintended pregnancy and sexually transmitted infections, including HIV infection.
- Alcohol and other drug use.
- Tobacco use.
- Unhealthy dietary behaviors.
- Inadequate physical activity.

ABES Design Compared to YRBS

Similar to the Youth Risk Behavior Survey (YRBS), the ABES provides data representative of 9th through 12th grade students in public and private schools in the United States. The YRBS questionnaire, data collection procedures, and data processing were adapted to create the online ABES survey. The ABES questionnaire contains 81 questions identical to 2021 standard YRBS questions (Appendix A). An additional 23 questions were added to the ABES questionnaire, and six standard YRBS questions were modified to allow students attending school only virtually to indicate when a question did not apply to them (Appendix B). The ABES used photos and illustrations in connection with certain questions to improve students' recognition of particular tobacco products, drugs, and contraceptive methods. In addition, each record contains information collected from the school the student was attending at the time of data collection, such as the school's instructional model (e.g., in-person, virtual, hybrid) (Appendix D).

The ABES was designed to

- Assess the health impact of the COVID-19 pandemic.
- Determine the prevalence of health risk behaviors.
- Examine the co-occurrence of health risk behaviors.

Although data collectors administer the national YRBS in schools using paper-and-pencil questionnaires, the ABES was designed to be completed outside of school using a secure web-based platform.

ABES data should not be combined with YRBS data. Comparisons should not be made between ABES and YRBS results because surveys use different data collection modes (web-based vs. paper-and-pencil) and settings (out-of-school vs. in-school).

Methods

The ABES used a three-stage cluster sample design to produce a representative sample of 9th through 12th grade students. The target population consisted of all public, Catholic, and other private school students in grades 9 through 12. Teachers of sampled classes watched a brief online video that provided instructions for survey administration. Teachers distributed parental permission forms and survey login information to their students and completed a class enrollment form. Students watched an online video that provided them with instructions for logging in and completing the questionnaire in English or Spanish.

A weighting factor was applied to each student record to adjust for nonresponse and the oversampling of black and Hispanic students in the sample. The final, overall weights were scaled so the weighted count of students was equal to the total sample size, and the weighted proportions of students in each grade matched population projections for each survey year. Because of the complexity of the cluster sampling design used, a statistical software package that can calculate sampling variance appropriately must be used. This document provides the information needed to correctly use and analyze data from the 2021 ABES.

Sample Description

School Level Selection

All regular public, Catholic, and other private schools that serve students in grades 9 through 12 in the 50 States and the District of Columbia were included in the sampling frame for the 2021 ABES. Puerto Rico, the trust territories, and the Virgin Islands were excluded from the frame. Schools were selected systematically with probability proportional to enrollment in grades 9 through 12 using a random start. Three hundred and thirty-nine schools were sampled.

Class Level Selection

All classes in a required subject were included in the sampling frame. Systematic equal probability sampling with a random start was used to select classes from each school that participated in the survey. All students in the selected classes who could complete the web-based questionnaire without assistance were eligible to participate.

Response Rates

The 2021 ABES attained the following response rates:

School response rate - 128 of the 339 sampled schools participated.

128/339 = 37.8% school response rate

Student response rate -7,998 of the 16,037 sampled students submitted questionnaires; 7,705 questionnaires were usable after data editing.

$$7,705/16,037 = 48.0\%$$

Overall response rate = School response rate * Student response rate

Data Edits

Introduction

Data edits consist of checking responses for height/weight plausibility and logical consistency. Data deemed invalid are set to missing.

Height and Weight Edits

The possible responses for height ranged from "3" to "7" for feet and from "00" to "11" for inches. The height in feet and inches was converted to height in meters using the formula below.

$$Height (in m) = [(feet \times 12) + inches] \times 0.0254 m/in$$

- If either feet or inches is not filled in, then Height is set to missing.
- If Weight is missing or set to missing, then Height is set to missing.

The possible responses for weight ranged from "74" to "399" pounds. The weight in pounds is then converted to weight in kilograms using the following formula:

Weight (in kg) = Weight (in lbs)
$$\times$$
 0.4536 kg/lb

- If no option is selected, Weight is set to missing.
- If Height is missing or set to missing, then Weight is set to missing.

Body Mass Index (BMI) Edits

BMI is calculated using Height and Weight in the following formula:

$$BMI = kg/m^2 = Weight (in kg)/[Height (in m)^2]$$

- If Height or Weight are missing, BMI is set to missing.
- If age or sex is missing, Height, Weight, and BMI are set to missing based on biologically implausible limits by age and sex (see next section).

Biologically Implausible Value Edits

When the basic edits for BMI are complete, further edits are applied to Height, Weight, and BMI to ensure the results are biologically plausible. Height, Weight, and BMI are set to missing when an observation lies outside the following limits developed by the Division of Nutrition, Physical Activity and Obesity, CDC. Logical Consistency Edits

The majority of the edit criteria compare two questions at a time to ensure logical consistency. If responses from two questions conflict logically, both questions are set to missing (age, sex, grade, ethnicity, and race questions are not subject to editing, and respondents may report multiple races).

Edits used for the 2021 ABES questionnaires follow. Question numbers in this list match the appendices in this document (not the questionnaire). If the edit criteria are met, data from the questions are changed to missing.

Subverting Records

Subverting eliminates records that are judged too incomplete overall to be valid for analysis. Records are marked "subverted" when a student answers 20 or fewer questions or answers with b, c, d, e, f, g, or h 15 or more times in a row. When records are subverted, all values except the demographic variables are set to missing.

Calculated Variables

Introduction

Describes how the race/ethnicity, overweight, obese, and dichotomous variables are calculated

Race/Ethnicity

Race/ethnicity (*raceeth*) for the 2021 ABES is computed from two questions:

- 4. Are you Hispanic or Latino?
 - A. Yes
 - B. No
- 5. What is your race? (Select one or more responses.)
 - A. American Indian or Alaska Native
 - B. Asian
 - C. Black or African American
 - D. Native Hawaiian or Other Pacific Islander
 - E. White

Race (Q5) is the only ABES question that permits the selection of more than one response. If the student selected "B" for Q4 and only one response option for Q5 then raceeth is set to a number between "1" and "5" depending on the Q5 option selected. If they selected "A" for Q4 and no response for Q5, raceeth is set to "6" indicating "Hispanic/Latino". If they selected "A" for Q4 and one or more responses for Q5, then raceeth is set to "7" indicating "Multiple – Hispanic/Latino". If they selected "B" for Q4 and more than one response for Q5, then raceeth is set to "8" indicating "Multiple – Non-Hispanic/Latino". Raceeth is set to "missing" if they answered "B" to Q4 and left Q5 blank, or they left Q4 blank regardless of the response for Q5.

Ethnicity	Race	Raceeth (Values and Labels*)
В	A	1 (American Indian/Alaskan Native)
В	В	2 (Asian)
В	С	3 (Black or African American)
В	D	4 (Native Hawaiian or Other Pacific Islander)
В	Е	5 (White)
A	Missing	6 (Hispanic/Latino)
A	1 or more responses	7 (Multiple– Hispanic/Latino)
В	2 or more responses	8 (Multiple– Non-Hispanic/Latino)
В	Missing	Missing
Missing	Missing or Any response	Missing

Percentile, Overweight, and Obese

Age (Q1), Sex (Q2), and BMI are used to determine *Overweight* (QNOWT) and *Obese* (QNOBESE). The student is considered overweight, and QNOWT is set to "1", when BMI percentile is at or above the 85th percentile and below the 95th percentile for BMI by age and sex. The student is considered obese, and QNOBESE is set to "1", when BMI percentile is at or above the 95th

percentile for BMI by age and sex. If BMI is missing, then QNOWT and QNOBESE are set to missing. QNOWT and QNOBESE are mutually exclusive. The BMI percentile for age and sex (BMIPCT), QNOWT, and QNOBESE variables are included in the edited data set.

The "SAS Program for the 2000 CDC Growth Charts" developed by the CDC's Division of Nutrition, Physical Activity, and Obesity has been used to calculate BMI and BMI percentile for age and sex, and to generate QNOWT and QNOBESE. This program and technical documentation for its use are posted at:

https://www.cdc.gov/nccdphp/dnpao/growthcharts/resources/sas.htm

and are available for use by anyone who would like to regenerate the variables. Note the units required by the SAS program are specified in the documentation available at the web site referenced above. ABES data for height are stored in meters but the program requires height in centimeters. The program requires age in months but ABES only has age in years. Therefore, age in months is approximated by adding six months to the age in years reported by the respondent. That is, if a ABES respondent reports that they are 14 years of age, their age in months is calculated as (14 years * 12 months) + 6 months = 174 months.

Dichotomous Variables

There are two types of dichotomous variables - **QN#** and **QNword**. The dichotomous variables present the percentage of students answering the predetermined response(s) of interest (ROI). Students answering the ROI(s) are in the numerator. The denominator is either all students or a subset of students who have indicated they participate in a selected activity or behavior. Students must have provided valid data to be included in any dichotomous variable calculations. Therefore, students with missing responses or who had their answers subverted are not included. The variables are created and added to the master dataset during editing.

QN# Variables:

Each standard question will have a corresponding dichotomous variable. The name of the dichotomous variable corresponds to the original question number. For example, the dichotomous variable for Q10 is named QN10. The table below provides the question and response options used for each standard Q# variable and related QN# variable. The bolded responses indicate the ROIs for that question. The ROIs are set to "1" for the QN# variables; the remaining responses are set to "2" or to "missing" for the QN# variable. The numerator and denominator are further defined below the responses.

See Appendix A for the list of the ABES questions and dichotomous variables.

QNword Variables

QNword variables are supplemental, dichotomous variables that are calculated based on results from one or more questions. How these variables are derived, including which students are used in the numerator and denominator, and the SAS program used are explained in Appendices C and D. The values included in the SAS programs are numbers that correspond to the original responses; 1 = A, 2 = B, etc.

See Appendix C for the list of the ABES supplemental (QNword) variables.

Data Analysis Variables

Weight

A weight based on student sex, race/ethnicity, and grade level was applied to each record to adjust for school and student nonresponse and oversampling of black and Hispanic students. The overall weights were scaled so that the weighted count of students equals the total sample size, and the weighted proportions of students in each grade match the national population proportions. Thus, the data are representative of students in grades 9-12 in public and private schools in the United States. "WEIGHT" indicates the weight factor assigned to each student record.

Stratum

The sample design employed a three-stage cluster sample stratified by racial/ethnic concentration and MSA status. "STRATUM" indicates the stratum the school the student attends was assigned to.

PSU

PSUs consist of counties, groups of smaller adjacent counties, or sub-areas of very large counties. "PSU" indicates the PSU the school the student attends was assigned to.

Analysis Technical Notes

Introduction

This section explains suppression criteria and the requirements for software that can precisely calculate sampling variances for cluster sample designs that must be used when analyzing ABES data.

Suppression Criteria

ABES prevalence estimates are considered statistically unreliable when the denominator is less than 30. In such cases, prevalence estimates should not be reported. Alternatively, analysts may choose to implement the full set of suppression criteria developed by the <u>National Center for Health Statistics</u>.

Software Requirements

The ABES uses a multi-stage cluster sample design. Statistical software used to analyze ABES data should account for this design. Although the point estimates should always match, there may be small differences in the confidence intervals calculated using different software packages as different methods for calculating standard errors are used. Many packages with this capability are available. For more information on six statistical packages (SUDAAN, SAS, STATA, SPSS, Epi Info, and R) that can be used to analyze ABES data, refer to the Software for Analysis of YRBS Data document on the YRBS web site at:

http://www.cdc.gov/healthyyouth/data/yrbs/methods.htm.

Sexual Minority Data Analysis Notes

Introduction

This section explains the best practices for analyzing data from the sexual identity and sex of sexual contacts questions on the ABES.

Background

Sex of sexual contacts (Q64) and sexual identity (Q65) may both be used to identify sexual minority youth. Sexual minority youth defined by sex of sexual contacts include those who have had sexual contact with only the same sex or with both sexes. Sexual minority youth defined by sexual identity include those who identify as gay, lesbian, and bisexual, those who describe their sexual identity some other way, and those who are not sure about their sexual identity.

Sexual identity

Response options for sexual identity in ABES are not the same as the 2015, 2017 and 2019 YRBS. YRBS response options were previously "heterosexual (straight)," "gay or lesbian," "bisexual," and "not sure." For ABES, the "not sure" response option was revised to offer the following options: "I describe my sexual identity some other way", "I am not sure about my sexual identity (questioning)," and "I do not know what this question is asking". For analysis, the response options can be categorized in different ways as shown in Table 1.

Table 1. Sexual minority variable from sexual identity.

Which of the following best describes you?	Category
Heterosexual (straight)	Heterosexual
Gay or lesbian	Gay, lesbian, or
Bisexual	bisexual
I describe my sexual identity some other way	Other/
I am not sure about my sexual identity (questioning)	questioning
I do not know what this question is asking	Missing

Sex of sexual contacts

In ABES, sex of sexual contacts was ascertained with the question, "During your life, with whom have you had sexual contact?" Response options were "I have never had sexual contact," "females," "males," and "females and males." No definition was supplied for sexual contact, so it is likely that students considered a range of sexual activities when responding to this question. To create a sexual minority variable from the sex of sexual contacts question, it is necessary to cross sex with sex of sexual contacts (Table 2). Sexual behavior questions require special consideration, as students with no sexual contact are excluded from analyses. Students who had sexual contact

with the same sex only had different needs for birth control and condom use, and exclusions are applied for these students as noted in Table 2.

Table 2. Sexual minority variable from sex and sex of sexual contacts.

Sex	During your life, with whom have you had sexual contact?			
	I have never had	Females	Males	Females and
	sexual contact			males
Female	No sexual	Same sex	Opposite	Both sexes
	contact*	only ^{†,§}	sex only	
Male	No sexual	Opposite	Same sex	Both sexes
	contact*	sex only	only [†]	

^{*} Excluded from analyses on sexual behaviors.

For more background information and example SAS code, please refer to the <u>How to Analyze YRBS Sexual Minority Data</u> document on the YRBS website at:

http://www.cdc.gov/healthyyouth/data/yrbs/methods.htm.

[†] Excluded from analyses on birth control use.

[§] Excluded from analyses on condom use.

Codebook

Introduction The codebook documents the SAS, SPSS, and ASCII data files available for public use. See Appendix D for school variables and Appendix E for remaining variables in the data files.

The columns in the codebook include the following information:

Data Location

This column contains the numbers indicating the beginning and ending column position for each variable. The data location is relevant only when you are using the ASCII formatted data file; for the other files, you will reference data by variable name, not location.

Variable Name This column contains the variable names listed in the order that the variables appear in the data files. Please refer to Appendix A, B, or C of this document for more details on variable types and dichotomous variables.

Question Code and Label

This column contains information about each variable in the data file. For each question (Q1 through Q116, this column contains question text, response option codes, and response option text. For QN# and QNword variables, this column contains text that summarizes the "responses of interest", and the codes "1" and "2" for "Yes" and "No" respectively to indicate whether or not the response was one of the "responses of interest".

Unweighted Frequency

This column contains the number of students who chose a specific response option or response of interest.

Weighted Percentage

This column contains the percentage of students who chose a specific response option or response of interest. These percentages are weighted and represent students in the United States.

Appendix A: ABES Questions and Dichotomous Variables from the Standard YRBS

Introduction

This Appendix provides a description of 81 ABES variables that originated from the 2021 standard YRBS. The ABES variable names are numbered the same way as the standard YRBS questionnaire to facilitate data processing. Thus, this form provides a crosswalk between ABES question numbers and the standard YRBS question numbers.

A table on the next page compares standard question numbers to ABES question numbers. The standard question numbering does not correspond to the order of the questions in the ABES questionnaire, but it does correspond to how variables are numbered in the ABES data set. The remainder of the Appendix specifies how each question is used to create variables, including dichotomous (QN) variables. Notice that variable numbers appear consecutively, but <u>variable numbers are skipped if the standard question was not asked</u>. For example, the variable Q12 will not be found in the ABES data set because the ABES questionnaire did not contain the standard question Q12. If an ABES number is skipped in the table (for example, ABES Q25), it is an indication that an added question was placed somewhere in the questionnaire other than at the end (for example, refer to Appendix B to find that ABES Q25 is an added question corresponding with variable Q93).

Similar information is provided in Appendix B for ABES questions not in the standard YRBS questionnaire.

Appendix B: Additional ABES Questions and Dichotomous Variables

Introduction

This Appendix provides a description of 29 additional ABES questions that are not in the standard YRBS questionnaire. Placeholder numbers beginning with Q88 were used for data processing of added questions. Thus, this form provides a crosswalk between ABES question numbers and the placeholder number designated for additional questions.

A table on the next page begins with the standard question number Q88, which corresponds to the first added ABES question. The standard question numbering does not correspond to the order of the questions in the ABES questionnaire, but it does correspond to how variables are numbered in the ABES data set. The remainder of the Appendix specifies how each added question is used to create variables, including dichotomous (QN) variables. Notice that variable numbers appear consecutively, regardless of the position of the added question in the questionnaire.

It is not possible to simply revise standard YRBS questions, they must become "added" questions and are numbered independently of where they appear in the questionnaire. For example, ABES Q12 was revised from the standard Q12, and corresponds to variable Q88. Notice the variable Q12 does not appear in the ABES data set.

Appendix D: ABES School Variables

Introduction

This Appendix provides a list of variables collected from schools at the time of recruitment for participation in ABES. The variables describe information provided by the respondent's school and are not displayed in the codebook in Appendix E.

Variable name	Code and Description	Unweighted Frequency	Weighted Percentage
INSTRMDL	Mode of school instruction at time of school recruitment		
	1 Hybrid: Some students in-person only, some students virtual only	3,303	42.8%
	2 Hybrid: Students attend both in-person and virtually	1,827	22.3%
	3 In-person only	248	2.4%
	4 Virtual only	1,853	24.4%
	5 Other	474	8.1%
	Missing	0	

Note: Mode of school instruction was ascertained when the school was recruited for participation. If the mode of school instruction changed after recruitment, survey participation by student respondents may have continued under a different mode.
