

1999 National School-based Youth Risk Behavior Survey

Public-use Data Documentation

Introduction

The Youth Risk Behavior Surveillance System (YRBSS) is an epidemiologic surveillance system that was established by the Centers for Disease Control and Prevention (CDC) to monitor the prevalence of youth behaviors that most influence health. The 1999 national school-based Youth Risk Behavior Survey (YRBS) is one component of the YRBSS.

The YRBS focuses on priority health-risk behaviors established during youth that result in the most significant mortality, morbidity, disability, and social problems during both youth and adulthood. These include: behaviors that result in unintentional and intentional injuries; tobacco use; alcohol and other drug use; sexual behaviors that result in HIV infection, other sexually-transmitted diseases (STDs), and unintended pregnancies; dietary behaviors; and physical activity.

The results from the YRBS will be used by CDC to: (1) monitor how priority health-risk behaviors among high school students (grades 9-12) increase, decrease, or remain the same over time; (2) evaluate the impact of broad national, state, and local efforts to prevent priority health-risk behaviors; and (3) monitor progress in achieving relevant national health objectives for the year 2000. Results will also be used to help focus programs and policies for comprehensive school health education on the behaviors that contribute most to the leading causes of mortality and morbidity.

Data Characteristics

To make the data more widely available, a standardized data file has been prepared for distribution. This data documentation manual contains a detailed description of the file.

Format:	ASCII text
Record Length:	198
Number of Records:	15349

The data file and an electronic version of this document may be downloaded at no cost from <http://www.cdc.gov/nccdphp/dash/yrbs/datareq.htm>.

Methodology

The 1999 national school-based survey employed a three-stage cluster sample design to produce a nationally representative sample of students in grades 9-12. The first stage sampling frame contained 1,270 primary sampling units (PSUs), consisting of large counties or groups of smaller, adjacent counties. From the 1,270 PSUs, 52 were selected from 16 strata formed on the basis of the degree of urbanization and the relative percentage of black* and Hispanic students in the PSU. The PSUs were selected with probability proportional to school enrollment size. At the second sampling stage, 187 schools were selected with probability proportional to school enrollment size. To enable separate analysis of data for black and Hispanic students, schools with substantial numbers of black and Hispanic students were sampled at higher rates than all other schools. The third stage of sampling consisted of randomly selecting one or two intact classes of a required subject (e.g., English or social studies) from grades 9-12 at each chosen school. All students in the selected classes were eligible to participate in the survey. In addition, a small number of PSUs (with very large enrollment) that were selected with certainty were recoded as their own strata. The sampled schools within the strata created from "certainty PSUs" were then treated as PSUs within those strata.

Survey Procedures

Survey procedures were designed to protect the students' privacy by allowing for anonymous and voluntary participation. The students completed the self-administered questionnaire in their classrooms during a regular class period, recording their responses directly on a computer-scannable booklet or answer sheet. Local parental permission procedures were followed before survey administration.

Response Rate

15,349 questionnaires were completed in 144 schools. The school response rate was 77%, and the student response rate was 86%, resulting in an overall response rate of 66%.

Weighting

A weighting factor was applied to each student record to adjust for nonresponse and for the varying probabilities of selection, including those resulting from the oversampling of black and Hispanic students. The weights were scaled so that a) the weighted count of students was equal to the total sample size and b) the weighted proportions of students in each grade matched national population proportions. The data are representative of students in grades 9-12 in public and private schools in the 50 states and the District of Columbia.

Variance Estimation

Software that can precisely calculate sampling variances for a design of the complexity described here must be used when analyzing YRBS data. SUDAAN, produced by the Research Triangle Institute, is widely used for this but other packages are available. When using SUDAAN, we recommend using the “with replacement” sampling option, while building in the multiple stages of selection at the stratum and PSU levels into the model. SUDAAN assumes simple random sampling after the first stage of selection while the actual model was clustered at subsequent stages. Thus, SUDAAN-estimated variances will underestimate the true variances in the vicinity of 3 to 10 percent (based on analysis done by the CDC project contractor).
