

SPECIAL SUBSCALES

The following subscales, which assist in interpreting the results from the standard clinical scales, were scored. Note that in all instances raw scale scores were used and that a 2-standard deviation discrepancy from the male population mean was used for case definitions.

1. Wiener (1948) Obvious and Subtle Scales for Clinical Scales 2, 3, 4, 6, and 9

These scales were developed by grouping items from each of these scales into those that are "easy to detect as indicating emotional disturbance" (obvious), and those that are "relatively difficult to detect" (subtle). As Dahlstrom, Welsh, and Dahlstrom (1972) note: "In general, those subjects who are showing more severe forms of psychopathology tend to endorse the obvious items more than they do the subtle ones, while persons with milder forms of maladjustment will endorse primarily subtle items in their feelings and reactions." (p. 187) Subjects who may be attempting to present a pathological profile may also show higher obvious scores than subtle scores.

Scale	Code	Mean	Std. Dev.	Items
D-Obvious	D-O	9.64	4.92	40
D-Subtle	D-S	10.36	2.77	20
Hy-Obvious	Hy-O	4.67	4.22	32
Hy-Subtle	Hy-S	12.76	4.53	28
Pd-Obvious	Pd-O	5.88	3.62	28
Pd-Subtle	Pd-S	8.89	2.51	22
Pa-Obvious	Pa-O	2.68	2.88	23
Pa-Subtle	Pa-S	6.05	2.33	17
Ma-Obvious	Ma-O	5.88	2.92	23
Ma-Subtle	Ma-S	9.27	2.60	23

2. Harris and Lingo (1955) Clinical Subscales for Scales 2, 3, 4, 6, 8, and 9

The standard clinical scales are heterogeneous for item content; therefore, to assist clinicians and others in interpreting the scales, researchers have developed subscales of more homogeneous items within each scale. The Harris and Lingo (1955) scales represent some of the most comprehensive and widely used results of this approach. In our analysis, we used these subscales:

	Code	Description	Mean	Std.	Items
Depression	D1	Subjective depression	6.97	3.46	32
	D2	Psychomotor retardation	5.33	1.81	15
	D3	Physical malfunctioning	3.11	1.45	11
	D4	Mental dullness	2.00	2.02	15
	D5	Brooding	2.20	1.84	10
Hysteria	Hy1	Denial social anxiety	3.47	1.80	6
	Hy2	Need for affection	4.93	2.47	12

Continued

	Code	Description	Mean	Std.	Items
Hysteria – continued					
	Hy3	Lassitude-malaise	2.24	2.37	15
	Hy4	Somatic complaints	2.83	2.51	17
	Hy5	Inhibition aggression	2.56	1.38	7
Psychopath	Pd1	Family discord	1.81	1.72	11
Deviate	Pd2	Authority problems	4.18	1.62	11
	Pd3	Social imperturbability	7.61	2.49	12
	Pd4a	Social alienation	5.35	2.83	18
	Pd4b	Self-alienation	3.86	2.61	15
Paranoia	Pa1	Persecutory ideas	1.97	2.23	17
	Pa2	Poignancy	2.18	1.53	9
	Pa3	Naivete	3.79	2.04	9
Schizophr.	Sc1a	Social alienation	3.53	2.36	21
	Sc1b	Emotional alienation	2.21	1.15	11
	Sc2a	Lack ego mastery, cognitive	1.45	1.60	10
	Sc2b	Lack ego mastery, conative	2.00	1.83	14
	Sc2c	Lack ego mastery, defec. inh.	1.44	1.53	11
	Sc3	Bizzare sensory experiences	2.42	2.47	20
Hypomania	Ma1	Amorality	1.73	1.36	6
	Ma2	Psychomotor acceleration	3.68	1.42	11
	Ma3	Imperturbability	3.43	1.71	8
	Ma4	Ego inflation	2.62	1.63	9

SPECIAL RESEARCH SCALES

The following special research scales were developed to assess various constructs or disorders that the standard MMPI clinical scales do not assess. Some of the scales are based on factor analysis of the MMPI items. We included these scales in the VES analysis so that we could address specific hypotheses (PTSD) or have alternative indices of a specific construct (depression, Wiggins Depression Scale). Again, we defined cases as those deviating two standard deviations from the normative means for males.

3. Wiggins Content Scales (1969)

These scales were developed empirically on the basis of individual item content across clinical scales. The 13 scales are considered to be independent and internally consistent, and they represent the content dimensions of the MMPI:

Scale	Code	Mean	Std.dev.	Items
Social maladjustment	SOC	8.36	4.68	27
Depression	DEP	6.91	4.99	33
Feminine interest	FEM	9.12	3.60	30
Poor morale	MOR	7.51	4.54	23
Religious fundamental	REL	6.36	3.05	12
Authority conflict	AUT	9.50	4.02	20
Psychoticism	PSY	7.88	5.59	43
Organic Symptoms	ORG	5.21	4.13	36
Family Problems	FAM	3.66	2.33	16
Manifest Hostility	HOS	8.97	4.72	26
Phobias	PHO	5.47	3.67	26
Hypomania	HYP	11.93	4.44	25
Poor Health	HEA	4.68	3.69	28

4. Welsh Anxiety (A) and Repression (R) Factor Scales (Welsh, 1956)

On the basis of factor analysis of the basic validity and clinical scale, Welsh developed these two scales to assess the two basic dimensions underlying the entire MMPI. High scores on the A scale are generally associated with increasing unhappiness and anxiety. High scores on the R scale are generally associated with increasing internalization, control, and submissiveness. Thirty-nine items make up the A scale, and 40 the R scale. For the A scale, the mean for males is 11.28, and the standard deviation, 7.37. For the R scale, the mean for males is 11.59 and the standard deviation, 3.90.

5. Tryon, Stein, and Chu (1966) Body Symptom (Bs) and Tension (Te) Scales

These two scales were based on a factor analysis of the individual MMPI items. We chose these two scales because of their relevance to specific hypotheses being addressed in this study. The Body Symptom (Bs) scale includes 33 items; the mean is 5.33, and the standard deviation, 4.77. The Tension (Te) scale includes 36 items. The mean is 8.57, and the standard deviation, 5.23.

6. Taylor Manifest Anxiety Scale (1953)

This scale was constructed to select subjects with various anxiety levels for research purposes. Subjects who score high on this scale typically are emotionally affected in stressful situations. Physical and somatic symptoms are common for high scorers, as are problems with concentrating. This scale has 50 items. The mean for males is 12.57, and the standard deviation is 7.57.

7. Ego Strength (Es) Scale

This scale was developed to predict a subject's response to psychotherapy. Subjects with higher scores are typically better adjusted psychologically. This scale has 68 items. The mean for males is 37.66, and the standard deviation, 5.74.

8. Emotional Disorders (Ed) Scale (Dahlstrom, et al. 1972)

This scale was developed to assess general emotional dysfunction among participants in large community screenings. Subjects with higher scores are considered to be "emotionally distressed, anxious, and guilty." This scale has 20 items, a mean for males of 3.15, and the standard deviation, 2.88.

9. MacAndrew (1965) Alcoholism Scale

This scale was developed to differentiate alcoholics from nonalcoholic psychiatric patients. Higher scores represent a higher probability of alcohol abuse. This scale has 49 items, the mean for males is 19.52, standard deviation, 3.58.

10. Drug Abuse Scale (Panton and Brisson, 1971)

This 36-item scale was developed to identify subjects with drug abuse problems. The mean for males is 12.02, standard deviation, 2.66.

11. Post-Traumatic Stress Disorder Scale (PTSD) (Keane, et al. 1984)

This scale was developed on inpatient veterans to identify those with PTSD. A cutoff score of 30 on this 60-item scale was considered the most effective criterion for identifying inpatient veterans with PTSD.

CODE TYPES

Because some research results have suggested that differential diagnostic functions could best be carried out by using multiple-scale analysis, configural analysis in the form of code types was developed as an additional interpretative procedure. Two different approaches to code type development were undertaken. The primary approach was to identify all subjects who had T-scores equal to or greater than 70 on only one clinical scale (single peaks) and on two, three, or four clinical scales. For analysis, subjects who had elevated scores on more than four scales were placed in the "other" category. A review of all of the possible code types, both in elevation order and in scale order, showed very low prevalences for many combinations. Because of this finding, only those code types that had at least 10 subjects in them were further evaluated.

In addition to the above approach, we evaluated all profiles, using the Gilbertstadt-Duker (1965) profile prototypes. These prototypes included the 123, 1234, 1237, 132, 137, 138, 139, 27, 274, 278, 4, 43, 49, 78, 8123, 824, 86, 89, and 9. Because the criteria for these prototypes are so specific, very few VES veterans' profiles fell into one of these code types.

Code types are difficult to interpret. The following descriptions represent only brief labels for various combinations:

12/21-anxious, tense, nervous, somatic discomfort and pain although no evidence for organic basis, dysphoria.

13/31-psychophysiological disorders, conversion symptoms, immaturity, lack psychological insight.

14/41-may have alcohol problems, pessimistic, hypochondriacal symptoms.

18/81-may have bottled-up hostility and aggression, socially inadequate, possible severe psychopathology.

19/91-distress and turmoil, anxious, somatic complaints.

23/32-depression, passivity, dependent, overcontrolled.

24/42-impulsive, unable to delay gratification, little response to social rules and regulations, may have alcohol or drug problem.

27/72-affective distress, overreact to stress, depression, pessimistic.

28/82-anxiety, tension, confused mentation, ineffective, may suggest serious psychopathology.

29/92-feel inadequate, may become depressed.

34/43-anger, may be assaultive, lack insight, possible alcohol problems, passive-aggressive style.

36/63-defiant, mild suspiciousness.

38/83-anxiety, tension, depression, worry, possible disturbed thinking.

45/54-nonconformists, low frustration levels, passive-aggressive.

46/64-passive-dependent, repressed anger, possible suspiciousness.

47/74-acting out, possible alcohol and drug problems, guilt.

48/84-odd, erratic, irritable, unpredictable, alcohol and drug abuse may occur, marginal histories, possible psychosis.

49/94-does not follow social standards, antisocial, self-indulgent.

68/86-little emotional relationship with others, possible psychosis, delusions, schizoid.

69/96-anxious, overreact to stress, ruminative, possible psychosis.

78/87-in turmoil, depressed, worried, confused, panic, inadequate, schizoid, not psychotic.

89/98-hyperactive, labile, pressured, possible psychosis, thought disturbance, disoriented, possible drug abuse.
