Long-Term Care Providers and Services Users in the United States, Residential Care Component: National Study of Long-Term Care Providers, 2013–2014

Weighted National Estimates and Standard Errors

The enclosed document provides the weighted estimates and associated standard errors[1] for selected variables from the residential care community (RCC) component of the 2013-2014 National Study of Long-Term care Providers (NSLTCP). Data from the NSLTCP are restricted in order to maintain confidentiality of respondents, and can only be accessed through NCHS's Research Data Center.

Weighted estimates are provided for original variables based directly on the survey response categories as well as derived or new variables that are adaptations of the survey responses. While most of the estimates are at the residential care community level, in order to make the data more useful, we have converted residential care community-level variables to resident-level measures wherever applicable. For instance, the MEDPAID variable on page 2 is used to provide the following set of measures:

1. Percent of residential care communities, by percent of residents who had some or all of their long-term care services paid by Medicaid in the last 30 days. This residential care community-level measure was obtained directly from question…
   "During the last 30 days, for how many of the residents currently living in this residential care community, did Medicaid pay for some or all of their services received at this community?"
2. Total number of residents who had some or all of their long-term care services paid by Medicaid in the last 30 days. This resident-level measure

---

was derived by adding the total number of residents who had some or all of their long-term care services paid by Medicaid in the last 30 days.

3. Percent of current residents across all residential care communities who had some or all of their long-term care services paid by Medicaid in the last 30 days. This resident-level measure is derived as a ratio of the total number of residents using Medicaid to pay for services to the total number of residents across all residential care settings.

All measures are coded as "-1" if they follow a skip pattern in the questionnaire and are therefore legitimately skipped. The 2014 RCC questionnaire can be accessed at:
https://www.cdc.gov/nchs/data/nsltcp/2014_nsltcp_residential_care_communities_questionnaire.pdf

For the majority of measures, a separate category coded as "-9" indicates data not ascertained or missing data; the only exception being ratios, where the missing cases are not included in the calculations.

Information about the design and methodology of the 2014 NSLTCP in general, and the RCC component in particular, can be accessed at:
https://www.cdc.gov/nchs/data/nsltcp/nsltcp_2014_survey_methodology_and_documentation.pdf
