Pentetate Calcium			
Trisodium			
Photofrin	porfimer sodium		
Provera**	medroxyprogesterone acetate		
Quadramet	samarium 153 lexidronam		Each unit dose vial of this radiopharmaceutical consists of less than 100 mg strontium chloride mass in a volume of 4 mL. It is withdrawn from a rubber-stoppered vial using a syringe/needle and injected intravenously (ie, handling does not involve open containers). Risk is associated with radiation exposure, not with chemical exposure. Radiation risk is low, especially with application of radiation protection principles of time, distance, and shielding. Radioactive contamination is readily detectable, at even miniscule amounts, with a geiger counter survey meter. Moreover, handling of this drug is restricted to radiation-trained personnel per Nuclear Regulatory Commission and Agreement State Agencies regulations.
