Detailed Tables

Bone mineral density

1. Total lumbar spine (L1–L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	13
2. Lumbar spine vertebra 1 (L1) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	15
3. Lumbar spine vertebra 2 (L2) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	17
4. Lumbar spine vertebra 3 (L3) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	19
5. Lumbar spine vertebra 4 (L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	21

6.	Lumbar spine vertebrae 1 and 2 (L1, L2) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	23
7.	Lumbar spine vertebrae 1 and 3 (L1, L3) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	25
8.	Lumbar spine vertebrae 1 and 4 (L1, L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	27
9.	Lumbar spine vertebrae 2 and 3 (L2, L3) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	29
10.	Lumbar spine vertebrae 2 and 4 (L2, L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	31
11.	Lumbar spine vertebrae 3 and 4 (L3, L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	33
12.	Lumbar spine vertebrae 1, 2, and 3 (L1, L2, L3) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	35
13.	Lumbar spine vertebrae 1, 2, and 4 (L1, L2, L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	37
14.	Lumbar spine vertebrae 1, 3, and 4 (L1, L3, L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	39
15.	Lumbar spine vertebrae 2, 3, and 4 (L2, L3, L4) bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	41
16.	Total proximal femur bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	43
17.	Femur neck bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	45
18.	Trochanter bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	47
19.	Intertrochanter bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	49
20.	Ward's triangle bone mineral density (gm/cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	51

Bone mineral content

21.	Total lumbar spine (L1–L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	53
22.	Lumbar spine vertebra 1 (L1) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	55
23.	Lumbar spine vertebra 2 (L2) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	57
24.	Lumbar spine vertebra 3 (L3) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	59
25.	Lumbar spine vertebra 4 (L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	61
26.	Lumbar spine vertebrae 1 and 2 (L1, L2) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	63
27.	Lumbar spine vertebrae 1 and 3 (L1, L3) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	65
28.	Lumbar spine vertebrae 1 and 4 (L1, L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	67
29.	Lumbar spine vertebrae 2 and 3 (L2, L3) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	69
30.	Lumbar spine vertebrae 2 and 4 (L2, L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	71
31.	Lumbar spine vertebrae 3 and 4 (L3, L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	73
32.	Lumbar spine vertebrae 1, 2, and 3 (L1, L2, L3) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	75

33.	Lumbar spine vertebrae 1, 2, and 4 (L1, L2, L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	77
34.	Lumbar spine vertebrae 1, 3, and 4 (L1, L3, L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	79
35.	Lumbar spine vertebrae 2, 3, and 4 (L2, L3, L4) bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	81
36.	Total proximal femur bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	83
37.	Femur neck bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	85
38.	Trochanter bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	87
39.	Intertrochanter bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	89
40.	Ward's triangle bone mineral content (gm) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	91

Bone area

41.	Total lumbar spine (L1–L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	93
42.	Lumbar spine vertebra 1 (L1) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	95
43.	Lumbar spine vertebra 2 (L2) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	97
44.	Lumbar spine vertebra 3 (L3) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	99
45.	Lumbar spine vertebra 4 (L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	101
46.	Lumbar spine vertebrae 1 and 2 (L1, L2) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	103
47.	Lumbar spine vertebrae 1 and 3 (L1, L3) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	105
48.	Lumbar spine vertebrae 1 and 4 (L1, L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	107
49.	Lumbar spine vertebrae 2 and 3 (L2, L3) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	109
50.	Lumbar spine vertebrae 2 and 4 (L2, L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	111
51.	Lumbar spine vertebrae 3 and 4 (L3, L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	113
52.	Lumbar spine vertebrae 1, 2, and 3 (L1, L2, L3) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	115
53.	Lumbar spine vertebrae 1, 2, and 4 (L1, L2, L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	117
54.	Lumbar spine vertebrae 1, 3, and 4 (L1, L3, L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	119
55.	Lumbar spine vertebrae 2, 3, and 4 (L2, L3, L4) area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	121
56.	Total proximal femur area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	123
57.	Femur neck area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	125
58.	Trochanter area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	127
59.	Intertrochanter area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	129
60.	Ward's triangle area (cm ²) of persons aged 8 years and over, by sex, race and ethnicity, and age: United States, 2005–2008	131

Abstract

Objective

This report presents bone measurement data from dual-energy X-ray absorptiometry scans of the lumbar spine and proximal femur for persons aged 8 years and over from the National Health and Nutrition Examination Survey (NHANES) 2005–2008.

Methods

Means, standard deviations, and selected percentiles were calculated for the proximal femur and lumbar spine (total and subregions) by sex, race and ethnicity, and age. Smoothed mean total lumbar spine and femur neck bone mineral density (BMD) were plotted by age, sex, and race and ethnicity. Multiple regression was used to test for significant interactions and to calculate mean total lumbar spine and femur neck BMD after adjusting for age, sex, and race and ethnicity. Differences by sex, race and ethnicity, and age were summarized by calculating the percent difference in adjusted means.

Results

Among scanned individuals, 11% lacked total lumbar spine data due to invalid data for one or more lumbar vertebrae, and 4% had invalid data for the proximal femur. Non-Hispanic black persons had 6% higher total lumbar spine BMD and 9%–10% higher femur neck BMD than non-Hispanic white persons. Mean total lumbar spine BMD and femur neck BMD did not differ between Mexican-American and non-Hispanic white persons in those under age 20. For those aged 20 and over, Mexican-American persons had 4% lower total lumbar spine BMD but 1% higher femur neck BMD than non-Hispanic white persons. Mean total lumbar spine BMD was 8%–17% higher in females aged 8–15 compared with males of the same age. In the age group 16–49, mean total lumbar spine BMD was similar or slightly higher for females compared with males, but after age 50 it was 6%–15% lower for females compared with males. Mean femur neck BMD was 5%–13% lower for females than males in all age groups except 12–15.

Lumbar Spine and Proximal Femur Bone Mineral Density, Bone Mineral Content, and Bone Area: United States, 2005–2008

by Anne C. Looker, Lori G. Borrud, and Jeffery P. Hughes, National Center for Health Statistics; Bo Fan and John A. Shepherd, University of California, San Francisco; and L. Joseph Melton III, Mayo Clinic

Introduction

In 2005, the National Health and Nutrition Examination Survey (NHANES) implemented lumbar spine as well as proximal femur dual-energy X-ray absorptiometry (DXA) scans of survey participants aged 8 years and over. The inclusion of lumbar spine DXA measurements in NHANES 2005–2008 provides the first nationally representative data for this skeletal site for the U.S. population. Femur measurements made on the same sample can provide information about current femur skeletal status for the U.S. population. These two skeletal sites are among the most commonly used sites to assess skeletal status among adults. For example, the World Health Organization (WHO) recently designated the femur neck as the preferred skeletal site for assessing osteoporosis in populations (1), and it is currently the skeletal site included in the WHO fracture prediction model, FRAX® (2). However, a number of clinical guidelines are based on measurements at both the proximal femur and lumbar spine (3–7). The lumbar spine and proximal femur data from NHANES 2005–2008 provide the opportunity to examine demographic patterns in lumbar spine and proximal femur bone mineral density (BMD) for

males and females from multiple racial and ethnic groups across a wide age range.

Methods

NHANES is conducted by the Centers for Disease Control and Prevention's National Center for Health Statistics (NCHS). NHANES is a series of cross-sectional, nationally representative surveys of the U.S. civilian noninstitutionalized population. Samples are selected through a complex, multistage probability design (8). Individuals identified for the survey are initially interviewed in their homes. Following the household interview, survey participants are asked to complete the health examination component, conducted in mobile examination centers (MECs), which use standardized techniques and equipment for the collection of high-quality data. For reasons that include disclosure and reliability issues, the data are released on public-use data files every 2 years. The data used for this report are from 2005–2006 and 2007–2008. Public-use DXA data files and documentation can be found at the NCHS website for NHANES (9,10).

Sample Description

The NHANES target population is the U.S. civilian noninstitutionalized population. In 2005–2008, the survey was designed to provide statistically reliable estimates for non-Hispanic white, non-Hispanic black, and Mexican-American persons. In 2007–2008, the survey was also designed to provide statistically reliable estimates for “all Hispanics,” but estimates are not presented separately for all Hispanics in this report because the group was not oversampled in 2005–2006. Participants self-reported race and ethnicity. With the exception of pregnant females, survey participants aged 8 and over were eligible for the DXA scan. Participants were also excluded from the DXA examination if they reported radiographic contrast material (barium) use within the past 7 days or nuclear medicine studies within the past 3 days, or if they weighed over 300 pounds or were taller than 6’5” (due to the DXA device’s physical limitations). Participants who were excluded from the DXA scan for reasons other than pregnancy were considered to be eligible nonrespondents.

All procedures in NHANES 2005–2008 were approved by the NCHS Institutional Review Board. Written informed consent was obtained from all participants aged 18 and over prior to the study. For participants under age 18, parental consent and child assent was obtained. A total of 15,026 nonpregnant participants aged 8 and over were examined and found eligible for the DXA examination; this sample size includes those who did not receive DXA scans due to body size or safety reasons. Of this total sample, valid measurements for the proximal femur were obtained from 12,593, or 84%, and valid measurements for at least two lumbar vertebrae [required for calculating *T* or *Z* scores according to International Society for Clinical Densitometry (ISCD) guidelines (5)] were obtained from 12,865, or 86%. Valid measurements for all four lumbar vertebrae, which are required to

calculate data for the total lumbar spine, were obtained from 11,636, or 77%.

DXA Component

DXA scans were acquired with a Hologic QDR 4500A fan-beam densitometer (Hologic, Inc., Bedford, Massachusetts). Hologic software version 8.26:a3* was used to acquire all scans through mid-2005. In 2005, the acquisition software was updated to Hologic Discovery v12.4. All scans were administered by certified radiology technologists. Details of the DXA examination protocol are documented in the Body Composition Procedures Manual on the NHANES website (11,12). Data provided by DXA scans include BMD, bone mineral content (BMC), and bone area. DXA scans of the proximal femur provided data for the femur neck, trochanter, intertrochanter, Ward’s triangle, and total femur. DXA scans of the lumbar spine provided data for each lumbar vertebra separately (L1, L2, L3, and L4) as well as for the total lumbar spine (L1–L4).

All femur scans were analyzed with Hologic Discovery software version 12.1. All spine scans acquired in 2005–2006 and 2007–2008 were first analyzed with Hologic Discovery v12.4, then reanalyzed with Hologic APEX v3.0 software, which has been shown to have better precision for the spine (13). Comparisons of total spine BMD from each software version were made for the total sample and by age groups, race and ethnicity, and gender. Mean differences in BMD for 2005–2006 and 2007–2008 ranged from 0.00045 for “other” race and ethnicity to 0.00518 for participants aged 60 and over. Simple kappa statistics for BMD ranged from 0.9622 for participants aged 50–59 to 0.9899 for those aged 8–49. There were no differences between the two software versions in the percentages of participants in the total sample with BMD values plus or minus (+/–) three standard deviations (SD) from the mean BMD for the total sample. Differences in the percentages with BMD values +/- 3 SD from the mean in subgroups were seen, but they were not consistent across the two software versions; that is, for

some subgroups the Discovery version produced higher percentages of +/- 3 SD and for other subgroups the APEX software produced higher percentages. APEX results are used in this report.

A high level of quality control was maintained throughout the data collection period. In order to ensure that data collected in the three MECs used could be pooled for analysis, a rigorous quality control program was used to provide cross-calibration and longitudinal monitoring (11,12). The Hologic Anthropomorphic Spine Phantom that traveled with each MEC was scanned daily, as required by the manufacturer, to ensure accurate calibration of the densitometer and to correct for any longitudinal scanner-related changes in participant data. A single Hologic Spine and single Hologic Block Phantom were also circulated among the MECs and were scanned at the start of operations at each survey site; this provided additional data for use in longitudinal monitoring and cross-calibration. The University of California, San Francisco (UCSF), used the Cumulative Statistics method, or CUSUM, and MEC-specific phantom data to identify any breaks in the calibration of the densitometers over the course of the survey (14). However, there were no break points in the spine phantom data for any of the three MECs during 2005–2008, and, therefore, no corrections to the participant spine data were needed. Likewise, comparison of data for the spine and block phantoms that circulated among the MECs indicated no statistically significant differences, so that data from the three MECs could be combined.

Technologist acquisition performance was monitored through in-person observations in the field and subsequent scan review, with feedback provided as needed. Retraining sessions were conducted annually and as needed to reinforce correct techniques and appropriate protocol. Each participant scan was reviewed and analyzed by the NHANES quality control center at the UCSF Department of Radiology using standard radiologic techniques and study-specific protocols developed for NHANES. UCSF reviewers applied

invalidity codes to participant lumbar spine or proximal femur scans that could not be analyzed accurately. Reasons for invalid subregions included:

1. Jewelry and other objects not removed.
2. Nonremovable objects (prostheses, implants, or casts, among others).
3. Excessive X-ray “noise” due to truncal adiposity, which interfered with the ability to obtain valid measurements.
4. Arm or leg overlap.
5. Body parts outside the scan field.
6. Positioning problems.
7. Participant motion.
8. Other reasons (missing limbs, unknown artifacts, vertebral or proximal femoral fracture, or panniculus).

Invalidity codes were applied to each lumbar vertebra. If one or more vertebrae were coded as invalid, data for the total spine (L1–L4) were also coded as invalid; however, data for valid individual vertebrae were retained. In the case of the proximal femur, all femur subregions had to be valid in order for data to be retained for any of the subregions, consistent with the approach used for DXA data for the proximal femur in NHANES III (1988–1994) (15).

Statistical Analysis

In this report, BMD, BMC, and bone area data are presented for each lumbar vertebra and proximal femur subregion, as well as for total lumbar spine and total femur, by age, gender, and race and ethnicity. In addition, these data are provided for 10 combinations of two or three lumbar vertebrae (L1, L2; L1, L3; L1, L4; L2, L3; L2, L4; L3, L4; L1, L2, L3; L1, L2, L4; L1, L3, L4; and L2, L3, L4). Data analyses were performed using the statistical packages SAS version 9.2 (SAS Institute, Cary, North Carolina) and SUDAAN version 10.0 (RTI International, Research Triangle Park, North Carolina) or with the R survey package (University of Washington, Seattle, Washington) (16). Variance estimates were estimated by Taylor Series Linearization (17,18), a method that incorporates the sample

weights and accounts for the complex NHANES sample design. Sample weights calculated for examined respondents were applied to the data to account for differential probabilities of selection, nonresponse, and noncoverage. Estimates based on less than 12 degrees of freedom or with a relative standard error (RSE) greater than 30% were considered statistically unreliable (17,18). RSE is defined as the ratio of the standard error of the estimate divided by the estimate multiplied by 100. In the tables, estimates based on less than 12 degrees of freedom or with an RSE between 30% and 39% are identified with an asterisk (*). Estimates with an RSE greater than 40% or whose standard errors were not able to be calculated using SUDAAN due to small cell sizes were omitted from the tables. Means, standard deviations, and percentiles were calculated using SUDAAN PROC DESCRIPT. Means calculated for adults aged 20 and over were age adjusted to the 2000 U.S. standard population to facilitate comparisons between the sex and racial and ethnic subgroups (19).

To provide a detailed description of nonresponse to the lumbar spine scans, demographic characteristics of two groups of persons with missing lumbar spine data were examined: 1) scanned persons with one or more invalid vertebrae, because these individuals lack data for the total lumbar spine, which is commonly used to describe spine status in research studies; and 2) scanned persons with more than two invalid vertebrae, because ISCD clinical guidelines allow assessment of spine skeletal status via *T* and *Z* scores with valid data from a minimum of two lumbar vertebrae.

Total lumbar spine, femur neck, and total proximal femur BMD data were plotted by age, sex, and race and ethnicity using *Svsmooth*, a smoothing procedure available in the R survey package that is designed for use with surveys that employ complex designs (16). The femur neck was chosen because it has been proposed as the reference skeletal site for defining osteoporosis in epidemiological studies (1), while the total proximal femur was used for the osteoporosis objective in

Healthy People 2010 (20). The total lumbar spine was chosen because it is frequently used to describe spine status in epidemiological studies. Previous analyses found that a relatively high level of missing data occurred in the older age groups for the total lumbar spine due to invalid data for at least one lumbar vertebra (21). Despite this, previous analyses indicate that total lumbar spine data can be used to portray demographic patterns for the lumbar spine in older persons (21). Specifically, results for those over age 50 were found to be similar in persons with no invalid vertebra (and thus having valid total lumbar spine data) compared with those having two or more valid vertebrae (21).

Multiple regression (SUDAAN PROC REGRESS) was used to assess whether significant age × sex or age × race and ethnicity interactions in BMD levels existed and to calculate mean total lumbar spine BMD and femur neck BMD after adjusting for age, sex, and race and ethnicity. Interactions were tested separately by detailed age category for respondents under age 20 (age groups 8–11, 12–15, and 16–19) compared with those aged 20 and over (in decades) in order to reflect the biological differences in bone changes by age (bone growth in childhood and adolescence, maintenance of bone during adulthood, and bone loss with aging). If no significant interaction with age was observed, data were combined for ages 8–19 or ages 20 and over when calculating means by sex or race and ethnicity. Differences in mean BMD by sex and race and ethnicity by age were tested using *F* tests from multiple regression and were summarized by calculating the percent difference in adjusted means as:

$$\text{Percent difference} = \left(\frac{\text{Mean}_{\text{selected comparison group}} - \text{Mean}_{\text{reference group}}}{\text{Mean}_{\text{reference group}}} \right) \times 100$$

Non-Hispanic white persons were chosen as the reference group for all race and ethnicity comparisons, and males were chosen as the reference group for comparisons by sex. Use of terms such as “higher,” “lower,” and “greater” when describing differences in mean BMD between groups indicates that they differed statistically ($p < 0.05$). Terms such as “similar” or “did not

differ” indicate that the difference in mean BMD of the groups being compared was not statistically significant.

Patterns in BMC by age, sex, and race and ethnicity were also examined for respondents under age 20, because BMC is frequently used in epidemiological studies of children and adolescents. However, conclusions were the same as for BMD, so only BMD results are shown.

Key Findings

Means, standard deviations, and percentiles for BMD, BMC, and bone area of the lumbar spine and proximal femur are presented in Tables 1–60 for persons aged 8 and over. Information regarding invalid scan data is shown in Figures 1 and 2. Patterns in total lumbar spine and femur neck BMD by age, sex, and race and ethnicity are summarized in Figures 3–9.

Invalid Scan Results

- In NHANES 2005–2008, 13,106 survey participants received DXA scans of the lumbar spine. Eleven percent ($n = 1,470$) of those who received a spine scan had invalid data for at least one lumbar vertebra, and thus did not have data for the total lumbar spine. Most of these had invalid data for a single vertebra (6%). The percentage with invalid data for individual vertebrae among those who received a lumbar spine scan was 4% for L1, 4% for L2, 5% for L3, and 7% for L4. Three percent had invalid data for two of the four vertebrae, 1% had invalid data for three of the four vertebrae, and 1% had invalid data for all four vertebrae.
- Two percent ($n = 241$) of scanned survey participants had invalid data for more than two vertebrae, and thus could not have valid *T* or *Z* scores calculated. No differences by sex or race and ethnicity were seen in the percentage with more than two invalid vertebrae after adjusting

for age (Figure 1). However, after adjusting for sex and race and ethnicity, the percentage with more than two invalid vertebrae increased significantly with age (Figure 1), ranging from less than 1% in the youngest age group to 15% in the oldest age group. Similar patterns by age, sex, and race and ethnicity were seen among those with invalid data for more than one vertebra (e.g., missing total lumbar spine data) (data not shown).

- In NHANES 2005–2008, 13,193 survey participants received DXA scans of the proximal femur. Of these, 4% ($n = 600$) were missing data for the proximal femur due to invalid data. The percentage with invalid data for the proximal femur increased significantly with age (Figure 2) and differed by sex (females more than males) and race and ethnicity (non-Hispanic black persons more than non-Hispanic white and Mexican-American persons).

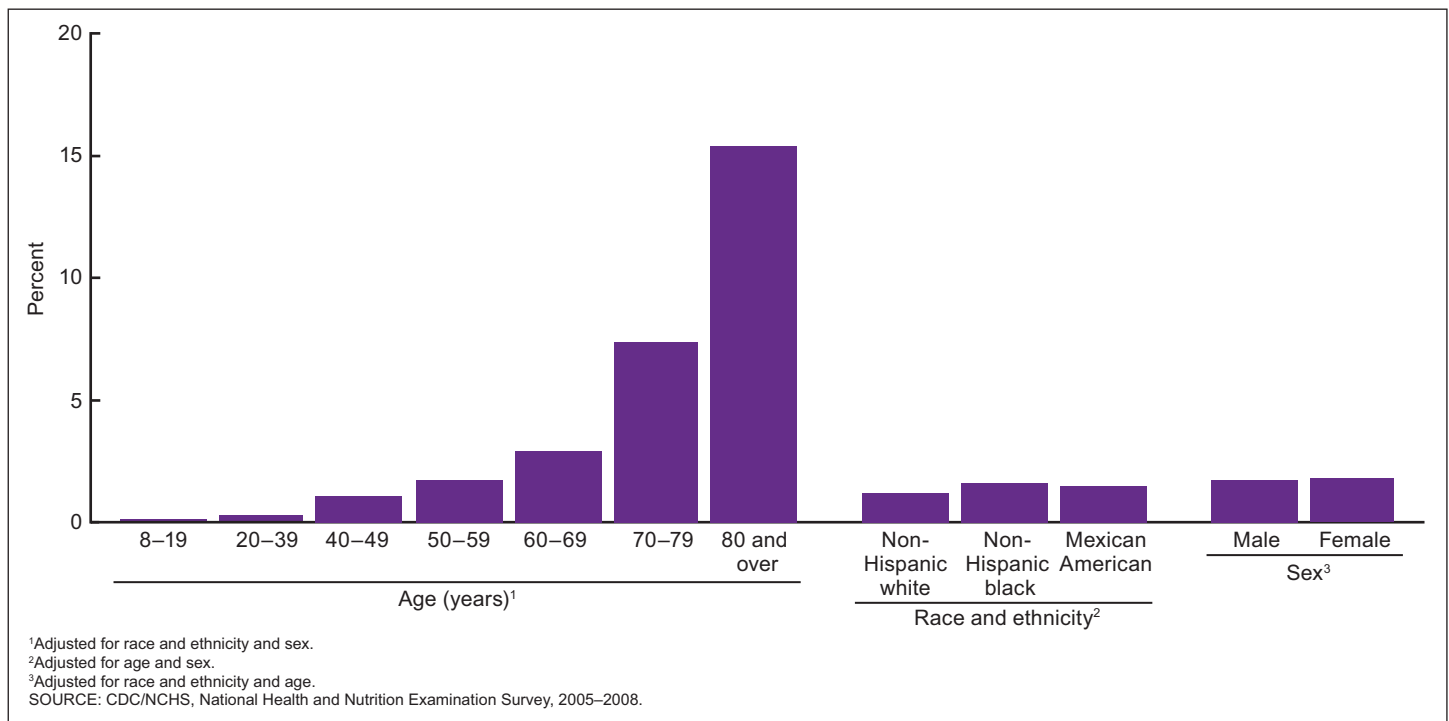

Figure 1. Percentage with invalid results for more than two lumbar vertebrae in persons aged 8 years and over, by age, race and ethnicity, and sex: United States, 2005–2008

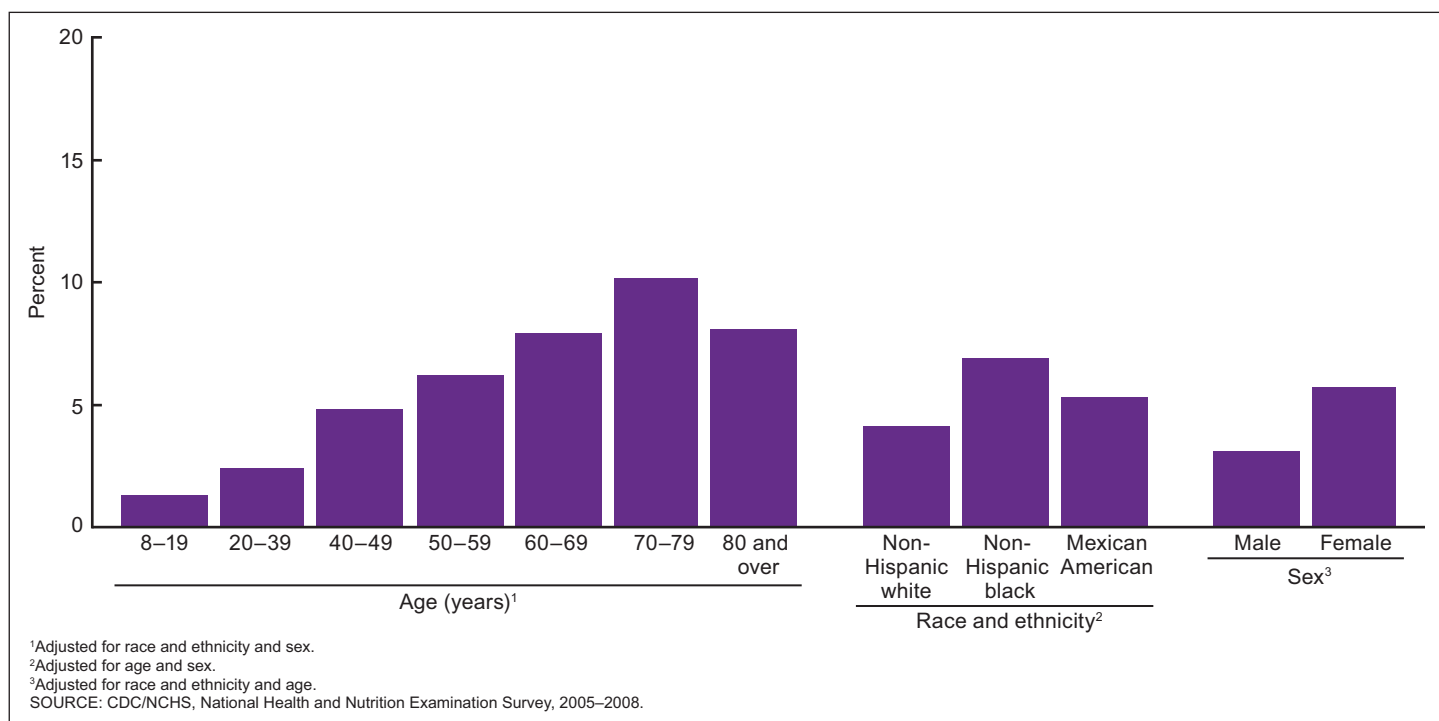

Figure 2. Percentage with invalid proximal femur results in persons aged 8 years and over, by age, race and ethnicity, and sex: United States, 2005–2008

BMD by Age, Race and Ethnicity, and Sex

- Smoothed mean total lumbar spine BMD increased until early adulthood and then remained relatively stable in males and females in the three race and ethnicity groups examined until approximately age 50 (Figure 3). After age 50, mean lumbar spine BMD remained stable or increased slightly in males but declined in females in the three race and ethnicity groups (Figure 3).
- Smoothed mean femur neck and total proximal femur BMD increased until early adulthood in males and females in all three race and ethnicity groups examined and then declined for both sexes (Figures 4 and 5).
- The age × race and ethnicity interaction term comparing mean BMD of non-Hispanic black with non-Hispanic white persons by detailed age group was not statistically significant among those aged 8–19 or those aged 20 and over at either skeletal site, so results for non-Hispanic black compared with non-Hispanic white persons were collapsed for ages 8–19 and 20 and over. Mean total lumbar spine BMD (adjusted for age and sex) of non-Hispanic black persons was 6% higher than in non-Hispanic white persons among both age groups 8–19 and 20 and over (Figure 6). Mean femur neck BMD (adjusted for age and sex) of non-Hispanic black persons was 9–10% higher than in non-Hispanic white persons among those aged 8–19 and 20 and over (Figure 6).
- The age × race and ethnicity interaction term comparing mean BMD of Mexican-American with non-Hispanic white persons by detailed age group was statistically significant for those aged 8–19 at the total lumbar spine but was not statistically significant for the femur neck. The age × race and ethnicity interaction term was not statistically significant for those aged 20 and over at either skeletal site. Thus, total lumbar spine results for Mexican-American compared with white persons were examined by detailed age group for those aged 8–19, but femur neck results were collapsed for ages 8–19. Results for both the total lumbar spine and femur neck were collapsed for those aged 20 and over. Mean total lumbar spine BMD (adjusted for sex) did not differ between Mexican-American and non-Hispanic white persons among age groups 8–11, 12–15, and 16–19 years (Figure 7). However, mean total lumbar spine BMD (adjusted for age and sex) was 4% lower in Mexican-American than in non-Hispanic white persons aged 20 and over (Figure 7). Mean femur neck BMD (adjusted for age and sex) did not differ between Mexican-American and non-Hispanic white persons under age 20 but was significantly higher in Mexican-American persons aged 20 and over (Figure 7).
- The age × sex interaction terms for total lumbar spine BMD and femur neck BMD by detailed age group were statistically significant among those aged 8–19 and 20 and over at both skeletal sites, so all results by sex are shown by detailed age

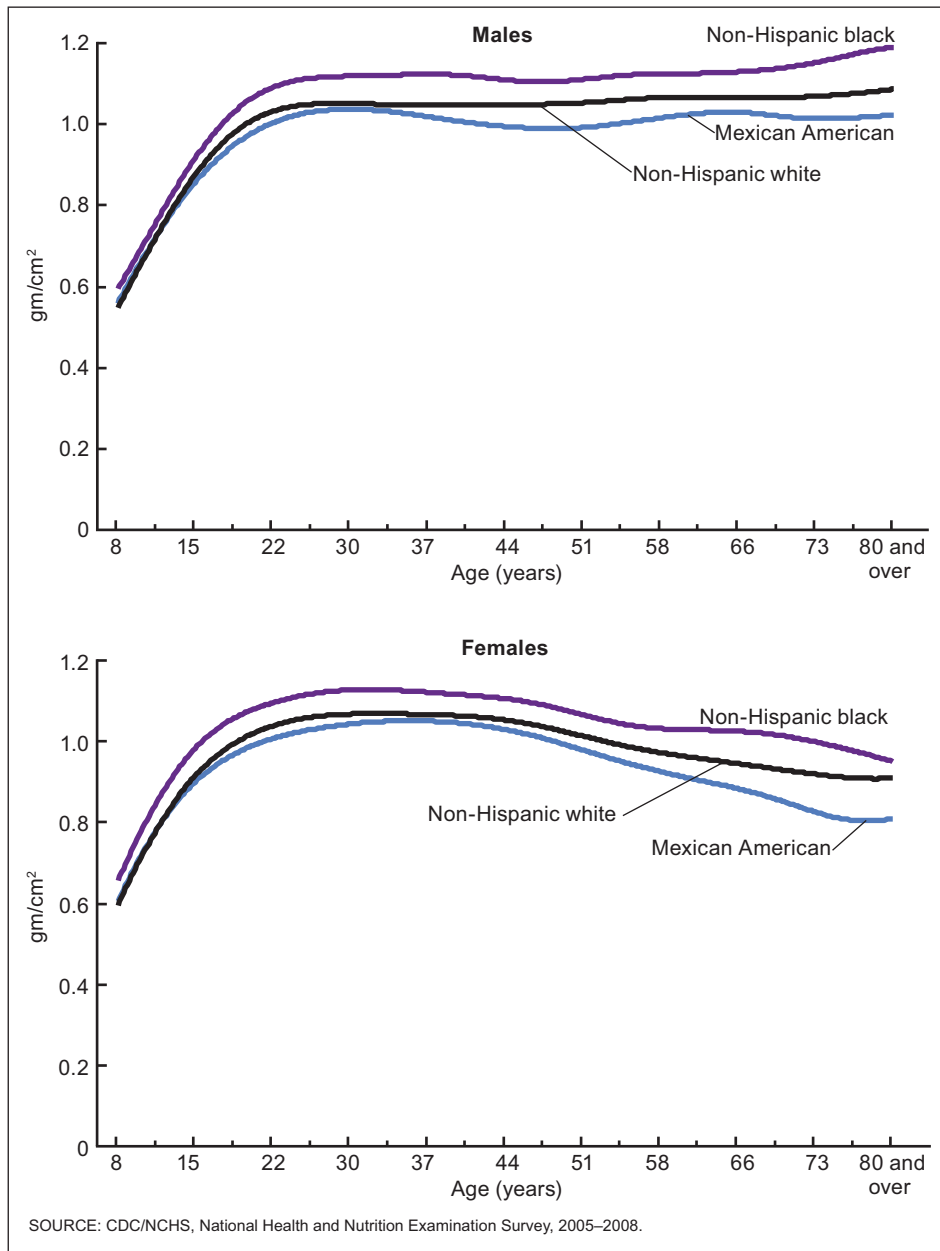

Figure 3. Smoothed mean total lumbar spine bone mineral density of persons aged 8 years and over, by age and race and ethnicity: United States, 2005–2008

categories. Mean total lumbar spine BMD (adjusted for race and ethnicity) was 6–14% higher in females aged 8–15 compared with males of the same age (Figure 8). Between ages 16 and 49, adjusted mean total lumbar spine BMD was similar or slightly higher (e.g., 2% for age group 30–39) for females

compared with males (Figure 8). After age 50, adjusted mean total lumbar spine BMD was 6–15% lower in females compared with males (Figure 8).

- Mean femur neck BMD (adjusted for race and ethnicity) was 5–13% lower for females than males in all age groups except 12–15 (Figure 9).

Vital and Health Statistics Series Descriptions

ACTIVE SERIES

- Series 1. **Programs and Collection Procedures**—This type of report describes the data collection programs of the National Center for Health Statistics. Series 1 includes descriptions of the methods used to collect and process the data, definitions, and other material necessary for understanding the data.
- Series 2. **Data Evaluation and Methods Research**—This type of report concerns statistical methods and includes analytical techniques, objective evaluations of reliability of collected data, and contributions to statistical theory. Also included are experimental tests of new survey methods, comparisons of U.S. methodologies with those of other countries, and as of 2009, studies of cognition and survey measurement, and final reports of major committees concerning vital and health statistics measurement and methods.
- Series 3. **Analytical and Epidemiological Studies**—This type of report presents analytical or interpretive studies based on vital and health statistics. As of 2009, Series 3 also includes studies based on surveys that are not part of continuing data systems of the National Center for Health Statistics and international vital and health statistics reports.
- Series 10. **Data From the National Health Interview Survey**—This type of report contains statistics on illness; unintentional injuries; disability; use of hospital, medical, and other health services; and a wide range of special current health topics covering many aspects of health behaviors, health status, and health care utilization. Series 10 is based on data collected in this continuing national household interview survey.
- Series 11. **Data From the National Health Examination Survey, the National Health and Nutrition Examination Surveys, and the Hispanic Health and Nutrition Examination Survey**—In this type of report, data from direct examination, testing, and measurement on representative samples of the civilian noninstitutionalized population provide the basis for (1) medically defined total prevalence of specific diseases or conditions in the United States and the distributions of the population with respect to physical, physiological, and psychological characteristics, and (2) analyses of trends and relationships among various measurements and between survey periods.
- Series 13. **Data From the National Health Care Survey**—This type of report contains statistics on health resources and the public's use of health care resources including ambulatory, hospital, and long-term care services based on data collected directly from health care providers and provider records.
- Series 20. **Data on Mortality**—This type of report contains statistics on mortality that are not included in regular, annual, or monthly reports. Special analyses by cause of death, age, other demographic variables, and geographic and trend analyses are included.
- Series 21. **Data on Natality, Marriage, and Divorce**—This type of report contains statistics on natality, marriage, and divorce that are not included in regular, annual, or monthly reports. Special analyses by health and demographic variables and geographic and trend analyses are included.
- Series 23. **Data From the National Survey of Family Growth**—These reports contain statistics on factors that affect birth rates, including contraception and infertility; factors affecting the formation and dissolution of families, including cohabitation, marriage, divorce, and remarriage; and behavior related to the risk of HIV and other sexually transmitted diseases. These statistics are based on national surveys of women and men of childbearing age.

DISCONTINUED SERIES

- Series 4. **Documents and Committee Reports**—These are final reports of major committees concerned with vital and health statistics and documents. The last Series 4 report was published in 2002. As of 2009, this type of report is included in Series 2 or another appropriate series, depending on the report topic.
- Series 5. **International Vital and Health Statistics Reports**—This type of report compares U.S. vital and health statistics with those of other countries or presents other international data of relevance to the health statistics system of the United States. The last Series 5 report was published in 2003. As of 2009, this type of report is included in Series 3 or another series, depending on the report topic.
- Series 6. **Cognition and Survey Measurement**—This type of report uses methods of cognitive science to design, evaluate, and test survey instruments. The last Series 6 report was published in 1999. As of 2009, this type of report is included in Series 2.
- Series 12. **Data From the Institutionalized Population Surveys**—The last Series 12 report was published in 1974. Reports from these surveys are included in Series 13.
- Series 14. **Data on Health Resources: Manpower and Facilities**—The last Series 14 report was published in 1989. Reports on health resources are included in Series 13.
- Series 15. **Data From Special Surveys**—This type of report contains statistics on health and health-related topics collected in special surveys that are not part of the continuing data systems of the National Center for Health Statistics. The last Series 15 report was published in 2002. As of 2009, reports based on these surveys are included in Series 3.
- Series 16. **Compilations of Advance Data From Vital and Health Statistics**—The last Series 16 report was published in 1996. All reports are available online, and so compilations of Advance Data reports are no longer needed.
- Series 22. **Data From the National Mortality and Natality Surveys**—The last Series 22 report was published in 1973. Reports from these sample surveys, based on vital records, are published in Series 20 or 21.
- Series 24. **Compilations of Data on Natality, Mortality, Marriage, and Divorce**—The last Series 24 report was published in 1996. All reports are available online, and so compilations of reports are no longer needed.
