APPENDIX E

Description of Neuropsychological Test Scores

NEUROPSYCHOLOGICAL TESTING

Because of the multifactorial nature of the various neuropsychological tests used in this study, we performed a series of correlational analyses to assess score redundancy within a test. We also performed an exploratory factor analysis of scores across tests. In the following review, we describe the scores obtained from each test, and their intercorrelations. Following this analysis, we performed factor analysis on the least redundant and theoretically meaningful test scores.

General Technical (GT) Score From the Army Classification Battery (ACB)

The general technical (GT) score is the average of the standard scores from the verbal reasoning and arithmetic reasoning subtests. It is considered to be a crude estimate of general abilities, or intelligence quotient (IQ), and has been correlated with results of more standard intelligence tests. The Army Classification Battery (ACB) was given to the veterans in this study when they were inducted into the Army. The GT score from this initial testing, pre-Vietnam service, was available from Army records. In this study, we used the same test forms to provide a current estimate of the veterans' general abilities. GT score at induction and GT score at examination were the primary variables of interest. Each of these scores has a theoretical mean of 100 and a standard deviation of 15. To assess the change in these scores between induction and interview, we created a percent change score: $(\text{GT interview} - \text{GT induction})/\text{GT induction} \times 100\%$. Therefore, three scores resulted from this test:

1. GT score at induction (GT_{Id})
2. GT score at interview (GT_{It})
3. Percent change in GT score between induction and interview.

The correlation matrix ($N=4462$) for these three scores is as follows:

	GT _{It}	% Change
GT _{Id}	.92	.25
GT _{It}	—	.13

Wechsler Adult Intelligence Scale – Revised (WAIS-R) Information and Block Design Subtests

The information subtest (Wechsler, 1981) is a measure of general information and correlates highly with measures of educational and socioeconomic background. The subtest is also considered to be a measure of long-term verbal memory because most of the questions require the subject to recall information typically learned in school. The block design subtest is a measure of visual-perceptual-motor, visual-spatial, and nonverbal reasoning abilities. This is a timed test, and, therefore, mental and motor speeds are components in a subject's performance. Both the information and block design subtests correlate highly with general IQ.

For each scale, we developed two scores: the raw score and the age-corrected scaled score (mean = 10, standard deviation = 3):

1. Information raw score (Infr)
2. Information scaled score (InfSS)

3. Block design raw score (BDR)
4. Block design scaled score (BDSS)

The intercorrelations ($N = 4462$) for these variables are as follows:

	BDSS	InfR	BDR
InfSS	.45	.98	.44
InfR	.45	—	.45
BDR	.98	.45	—

California Verbal Learning Test (CVLT)

This new test (Delis *et al.*, 1987) assesses active verbal learning and memory functioning by requiring the subject to recall a list of 16 words over 5 repeated learning trials. It provides numerous memory-related scores, including scores for total learning, short-delay and long-delay recall, and recognition. The following 22 scores were derived from this test:

1. Total correct trial 1 (CVLT1)
2. Total correct trial 5 (CVLT2)
3. Total correct trials 1-5 (CVLT3)
4. Total correct Tuesday list (CVLT4)
5. Total correct short-delay free recall (CVLT5)
6. Total correct short-delay cued recall (CVLT6)
7. Total correct long-delay free recall (CVLT7)
8. Total correct long-delay cued recall (CVLT8)
9. Total correct long-delay recognition (CVLT9)
10. Total perseverations - responses repeated (CVLT10)
11. Total intrusions - nontarget items reported (CVLT11)
12. Least-squares regression line - slope over trials 1-5 (CVLT12)
13. Primacy recall - percentage recall from primacy region (1st four words) (CULT13)
14. Recency recall - percentage recall from recency region (last four words) (CULT14)
15. Percent change, Monday trial 1 to Tuesday - reflects vulnerability to proactive interference (CVLT15)
16. Percent change, Monday trial 5 to short-delay free recall - reflects vulnerability to retroactive interference (CVLT16)
17. Percent change, short-delay cued to short-delay free recall (CVLT17)
18. Percent change, short-delay free recall to long-delay free recall (CVLT18)
19. Percent enhancement of semantic clustering (CVLT19)
20. Percent change, long-delay cued recall to long-delay free recall (CVLT20)
21. Percent change, long-delay recognition to long-delay free recall (CVLT21)
22. Percent change, long-delay recognition to long-delay cued recall (CVLT22)

See correlation matrix in Table E.1.

Delis *et al.* (1987) have identified six factors on the CVLT: general verbal learning, a response discrimination, learning strategy, proactive effects, serial position effects and acquisition rate.

Table E.1 Correlation Matrix of California Verbal Learning Test Variables

CVLT20 -.02											

Rey-Osterrieth Complex Figure Drawing

This drawing test requires the veteran to reproduce a complex spatial figure. It assesses visual-perceptual-motor, visual-spatial, planning, organizational, and graphomotor functioning (Lezak, 1983). After the veteran had copied the design for the first time, he was required to recall and draw the design from immediate memory. After a 20-minute filled-delay, the veteran was again required to recall and draw the design from delayed memory. Five scores were derived from this test:

1. Direct copy score (Copy)
2. Immediate recall score (ImmR)
3. Delayed recall score (DelR)
4. Percent immediate decay ((ImmR-Copy)/Copy) (% ImD)
5. Percent delayed decay ((DelR-ImmR)/ImmR) (% DD)

The intercorrelation ($N=4462$) for these variables is as follows:

	Copy	ImmR	DelR	% ImD	% DD
Copy	—	.47	.48	.19	-.10
ImmR		—	.92	.94	-.34
DelR			—	.85	-.12
% ImD				—	-.36
% DD					—

Word List Generation Test

This test assesses language system functioning, speed of word retrieval from memory, and general vocabulary (Lezak, 1983). A subject had to generate for 60 seconds as many words as possible that began with a specific set of letters (F, A, S), or names of animals. Seven different scores were derived:

1. Recall letter F (F)
2. Recall letter A (A)
3. Recall letter S (S)
4. Total recall, F+A+S (FAS)
5. Recall animal names (Anim)
6. Total errors, F+A+S (FASE)
7. Total errors, animal names (AnimE)

	Anim	AnimE	FAS	FASE	F	A	S	Anim	
Anim	—	-.07	.42	-.02	F	—	.59	.61	32
AnimE		—	.00	.22	A		—	.61	38
FAS			—	-.01	S			—	40

Wisconsin Card Sort (WCS) Test

This test assesses concept-formation, problem-solving, and set-switching abilities and the use of feedback in decision making (Lezak, 1983). It is considered to be a measure of frontal/executive functions. The subject is required to sort a number of cards containing

various numbered and colored shapes into a set of categories based on the examiner's feedback. Responses were scored with a computer. Eight scores were developed from this test:

1. Mean number of trials per sort (WCS1)
2. Perseverations to countables (countables are trials completed) (WCS2)
3. Perseverations within category to countables (WCS3)
4. Correct responses to countables (WCS4)
5. Shifts on feedback to countables (WCS5)
6. Correct shifts on feedback to countables (WCS6)
7. Times lost set to countables (WCS7)
8. Compounds to countables (WCS8)

See Table E.2 for correlation matrix.

Table E.2 Correlation Matrix of Wisconsin Card Sort Variables

	WCS1	WCS2	WCS3	WCS4	WCS5	WCS6	WCS7	WCS8
WCS1		.64	.78	-.86	.76	.77	.71	-.48
WCS2			.89	-.87	.69	.61	.56	-.38
WCS3				-.91	.65	.59	.51	-.42
WCS4					-.90	-.77	-.66	.56
WCS5						.77	.63	-.61
WCS6							.82	-.37
WCS7								-.29

Paced Auditory Serial Addition Test (PASAT)

This test is a measure of mental control, mental speed, and computational and attentional abilities (Lezak, 1983). The subject is required to mentally add a sequence of numbers in rapid succession. Each set of numbers is presented at an increasingly rapid rate. In the pilot test, this test caused stress among some veterans; therefore, if a veteran's performance fell below 50% correct on any series, the test was discontinued. Five scores were derived from this test:

1. Total number of correct responses (TotNC)
2. Percentage of correct responses (% C)
3. Ranking of performance, number of lists completed (1-7) (RANK)
4. Total number of correct responses for list 1 (0-50) (% C1)
5. Total number of correct responses for list 4 (0-50) (% C4)

The correlation matrix ($N=4462$) for the first three scores is as follows:

	TotNC	% C	Rank
TotNC	—	.92	.97
% C		—	.88

Grooved Pegboard Test

This test assesses manual dexterity and fine motor speed in each hand (Lezak, 1983). Each hand is required to place a set of pegs into a grooved hole as quickly as possible. Time to completion is the score of interest. Six scores were derived from this test:

1. Number of seconds, right hand (Right)
2. Number of seconds, left hand (Left)
3. Number of seconds, dominant hand (DOM)

4. Number of seconds, nondominant hand (NDOM)
5. Percent difference between right/left hands (% DH)
6. Percent difference between dominant/nondominant hands (% DDom)

The correlation matrix ($N = 4462$) for these variables is as follows:

	Dom	NDom	% DDom	Right	Left	% DH
Dom	—	.65	.28	.95	.66	.26
NDom		—	-.54	.60	.92	-.50
% DDom			—	.28	-.55	.86
Right				—	.62	.25
Left					—	-.68

Two additional tests were given as part of the psychiatric, psychological, and neuropsychological evaluation: the reading subtest of the Wide Range Achievement Test-Revised and the Edinburgh Handedness Inventory.

Wide Range Achievement Test – Revised (WRAT-R) Reading Subtest

This subtest, which consists of reading single words, is highly correlated with educational background. A person taking the Minnesota Multiphasic Personality Inventory (MMPI) must read at least at a sixth-grade level; therefore, before the veterans began the MMPI, we used the WRAT-R subtest to screen them for reading ability. Veterans who did not meet the sixth-grade reading level were given all materials on audiotape. Two scores were derived:

1. Raw reading score (Raw)
2. Grade equivalent score (Grade)

The correlation between these two variables is .93.

Edinburgh Handedness Inventory Laterality Ratio

This scale assesses a subject's hand use in a variety of typical instances (writing, throwing, etc.). A score of 1.00 represents a "pure" right-hander, and score of 0.00 represents a "pure" left-hander. Any veteran whose score fell below .70 on this scale (11.8% of total sample) was classified as a nonright-hander. We used these handedness classifications as covariates in analyzing neuropsychological data because, in some samples, nonright-handers can exhibit diverse patterns of neuropsychological function that are different from the more common patterns seen in right-handers.

Factor Analysis

On the basis of our analysis of the redundancy of the various scores within each test, a review of the underlying score distributions, and theoretical considerations, we included the following 15 scores in a factor analysis:

Theoretical Construct	Actual Score Used
Fine Motor	Grooved Pegboard Dominant Hand Grooved Pegboard Percent Hand Difference
Spatial	Rey Copy WAIS Block Design Scaled Score
Verbal	WAIS Information Scaled Score Verbal Fluency Total (FAS) GT at Interview
Verbal Memory	CVLT Total Recall CVLT % Change, Short Delay Free Recall to Long Delay Free Recall CVLT % Change, Long Delay cued Recall to Long Delay Free Recall

Preliminary results from these exploratory factor analyses suggest that six basic factors underlie the tests that were given to all veterans. Factor 1 can be best described as a general abilities factor, which is best represented by the general technical score and results of the information and block design subtests of the Wechsler Adult Intelligence Scale-Revised. Factor 2 represents a set switching/set maintenance factor that is related to frontal/executive functions; it is best represented by results of components of the Wisconsin Card Sort Test. Factor 3 is a nonverbal memory factor, and it is best represented by the change scores on the Rey-Osterrieth Complex Figure Drawing Test. Factor 4 is a verbal memory factor, and it is best represented by the change scores on the California Verbal Learning Test. Factor 5, a manual dexterity factor, is represented by the Grooved Pegboard Test. Factor 6 appears to be a visual-perceptual-motor factor, and it is represented by the Rey-Osterrieth copy score. Because the battery was designed to quickly screen a large range of abilities in a short period of time, few actual scores represent each factor. This raises the issue of the reliability of the factors and of any factor scores derived via these analyses. Therefore, we used individual tests scores for all analyses.

APPENDIX G

*Indices of
Self-Reported Combat and Herbicide Exposure*

Table G.1 Average Score for Each Question in the Combat Exposure Questionnaire, by Quartile of the Summary Index

Question	Quartile			
	1 (N=579)	2 (N=542)	3 (N=710)	4 (N=650)
1. Part of unit that fired on the enemy ^a	0.21	0.89	1.51	2.16
2. Flew in aircraft over N. or S. Vietnam	0.81	1.35	1.92	2.44
3. Stationed at a forward observation post	0.14	0.50	1.29	2.37
4. Received incoming fire	1.09	1.99	2.43	3.13
5. Encountered mines or booby traps	0.10	0.58	1.40	2.66
6. Received sniper or sapper fire	0.53	1.33	2.00	2.92
7. Ever ambushed	0.02	0.22	0.85	1.98
8. Engaged Vietcong in firefight	0.04	0.42	1.40	2.73
9. Engaged NVA in a firefight	0.02	0.18	1.01	2.28
10. Saw Americans killed or injured	0.32	1.35	2.02	2.98
11. Saw Vietnamese killed or injured	0.26	1.28	1.97	2.99
12. Killed or thought killed someone	0.28	0.35	1.03	2.17

^a 0 = never, 1 = rarely, 2 = sometimes, 3 = often, 4 = very often for all questions. Scores for questions 6-12 were doubled for the index but are not doubled here.

Table G.2 Number of Positive Responses to Herbicide Exposure Questions by Level of Index

Type of Herbicide Exposure	Summary Herbicide Exposure Index			
	1 (N=1051)	2 (N=76)	3 (N=561)	4 (N=109)
1. In defoliated area	0	742	502	95
2. Present during spraying	0	0	478	84
3. Got on skin, clothing	0	0	300	68
4. Handled equipment	0	0	0	100
5. Sprayed herbicides	0	0	0	44

Table G.3 Distribution of Self-Reported Exposure to Combat and to Herbicides Among Vietnam Veterans in the Medical Examination Study

Herbicide Exposure Level	Quartile of the Combat Exposure Index				Total
	1	2	3	4	
1	414	276	243	118	1051
2	114	159	247	241	761
3	43	84	186	248	561
4	8	23	35	43	109
TOTAL	579	542	711	650	2482

Table G.4 Summary Statistics for Psychological and Neuropsychological Battery Tests: Combat Exposure Index^a

Race and Age	Place of Service	N	Mean	S.D.	S.E.	Percentile						
						Min	5th	10th	50th	90th	95th	Max ^b
All Races^c												
30-48 yrs	Vietnam	2482	23.8	16.4	0.33	0	2	3	22	47	54	72
