

The Third National Health and Nutrition Examination Survey (NHANES III), 1988-94, Series 11 No. 13A (Dental Pathogen Data and Documentation) Data Release.

The National Center for Health Statistics (NCHS) of the Centers for Disease Control and Prevention (CDC) collects, analyzes, and disseminates data on the health status of U.S. residents. The results of surveys, analyses, and studies are made known through a number of data release mechanisms including publications, mainframe computer data files, CD-ROMs, and the Internet.

The National Health and Nutrition Examination Survey (NHANES) is a periodic survey conducted by NCHS. The third National Health and Nutrition Examination Survey (NHANES III), conducted from 1988 through 1994, was the seventh in a series of these surveys based on a complex, multi-stage sample plan. It was designed to provide national estimates of the health and nutritional status of the United States' civilian, noninstitutionalized population aged two months and older.

This data release, Series 11 No. 13A, contains the NHANES III Periodontal Pathogen Antibody Phase 2 data file and documentation. This data release does not replace the previous NHANES III data releases. The released data is in flat text format. A SAS program is provided to read the flat data. The user is advised to have someone who knows SAS data step to adapt the provided SAS program to his or her specific SAS environment.

Background information on the procedures, survey components, questionnaires, examination and laboratory methods, and statistical analysis guidelines is available on the NHANES III Questionnaire and Reports and Reference Manuals (CD-ROM). All data users are strongly encouraged to review these reference materials and reports before analyzing NHANES III data.

Guidelines for Data Users

- o NHANES III survey design and demographic variables are found on the Household Adult Data File, Household Youth Data File, the Laboratory Data File and the Examination Data File. In preparing a data set for analysis, other data files should be merged with either or both of the Adult Household Data File or the Youth Household Data File to obtain many important analytic variables.
- o All of the NHANES III public use data files are linked with the common survey participant identification number (SEQN). Merging information from multiple NHANES III data files using this variable ensures that the appropriate information for each survey participant is linked correctly.
- o NHANES III public use data files do not have the same number of records on each file. The Household Questionnaire Files (divided into two files, Adult and Youth) contain more records than the Examination Data File because not everyone who was interviewed completed the examination. The Laboratory Data File contains data only for persons aged one year and older. The Individual Foods Data File based on the dietary recall, the Prescription Medication Data File, and The Vitamin and Minerals Data File all have multiple records for each person rather than the one record per sample person contained in the other data files.
- o For each data file, SAS program code with standard variable names and labels is provided as separate text files on the CD-ROM that contains the data files. This SAS program code can be used to create a SAS data set from the data file.
- o Modifications were made to items in the questionnaires, laboratory, and examination components over the course of the survey; as a result, data may not be available for certain variables for the full six years. In addition, variables may differ by phase since some changes were implemented between phases. Users are encouraged to read the Notes sections of the file documentation carefully for information about changes.
- o Extremely high and low values have been verified whenever possible, and numerous consistency checks have been performed. Nonetheless, users should examine the range and frequency of values before analyzing data.
- o Some data were not ready for release at the time of this publication due to continued processing of the data or analysis of laboratory specimens. A listing of those data are available in the general information section of each data file.
- o Confidential and administrative data are not available or released to the public. Additionally, some variables have been recoded to protect the confidentiality of the survey participants. For example, all age-related variables were recoded to 90+ years for persons who were 90 years of age or older.
- o Some variable names may differ from those used in the Phase 1 NHANES III Provisional Data Release and some variables included in the Phase 1 provisional release may not appear on these files. Do not use the Phase 1 provisional release; use the current (six-year) release.

- o Although the data files have been edited carefully, it is possible that errors may still exist. Please notify NCHS staff (301-458-4636) of any suspected errors in the data file or the documentation. Refer to the NCHS website at <http://www.cdc.gov/nchs/nhanes.htm> for updates to these data files.

Analytic Considerations

- o NHANES III (1988-94) was designed so that the survey's first three years, 1988-91, its last three years, 1991-94, and the entire six years were national probability samples. Analysts are encouraged to use all six years of survey results.
- o Sample weights are available for analyzing NHANES III data. One of the following three sample weights will be appropriate for nearly all analyses: interviewed sample final weight (WTPFQX6), examined sample final weight (WTPFEX6), and mobile examination center (MEC)- and home-examined sample final weight (WTPFHX6). Choosing which of these sample weights to use in any analysis depends on the variables being used. A good rule of thumb is to use "the least common denominator" approach. In this approach, the user checks the variables of interest. The variable that was collected on the smallest number of persons is the "least common denominator," and the sample weight that applies to that variable is the appropriate one to use for that analysis. For more detailed information, see the Analytic and Reporting Guidelines for NHANES III (U.S. DHHS, 1996).

Referencing or Citing NHANES III Data

- o In publications, please acknowledge NCHS as the original data source. For instance, the reference for this Dental Pathogen Antibody Data File in this release is: U.S. Department of Health and Human Services (DHHS). National Center for Health Statistics. Third National Health and Nutrition Examination Survey, 1988-1994, NHANES III Dental Pathogen Antibody Phase 2 data file (Series 11, No. 13A). Hyattsville, MD: Centers for Disease Control and Prevention, 2001.

Problems Using the Data

NHANES III is a wonderfully rich source of data and NCHS encourages you to use the data for research and analysis. However, the dataset is large and complex and familiarity with data file manipulation and analysis is required. NCHS does not have the personnel resources to perform analyses, check results, debug programs or do literature review for your work. Thorough review of the extensive documentation on the planning of the survey, analytic guidelines and individual datasets should resolve most questions. If you still have questions after careful review of the documentation, please contact the Data Dissemination Branch at (301)458-4636.

NHANES III Dental Pathogen Component Index

Description	Variable Name	Positions
Respondent identification number	SEQN	1-5
A. Actinomycetemcomitans (Aa) antibody level..	DEPAA	6-9
P. Gingivalis (Pg) antibody level	DEPPG	10-14
A. Actinomycetemcomitans (Aa) positive	DEPAAPOS	15
P. Gingivalis (Pg) positive	DEPPGPOS	16

NHANES III Data File

Positions SAS name	Counts	Item description and code	Notes
1-5 SEQN	9385	Respondent identification number 32228-53623	
6-9 DEPAA	9372 13	A. Actinomycetemcomitans (Aa) antibody level 0046-1994 Blank	
10-14 DEPPG	9371 14	P. Gingivalis (Pg) antibody level 00040-22885 Blank	
15 DEPAAPOS	1315 5500 2557 13	A. Actinomycetemcomitans (Aa) positive 1 Yes 2 No 3 Equivalent Blank	
16 DEPPGPOS	1261 7898 212 14	P. Gingivalis (Pg) positive 1 Yes 2 No 3 Equivalent Blank	

NHANES III Periodontal Pathogen Antibody Data Special Notes

This documentation is specific to the Periodontal Pathogen Antibody File and is divided into three sections. The first section, "General Information and Scope of Data Release," provides background information concerning the file contents. The second section, "Surplus Sera Collection and Periodontal Pathogen Collection," provides information about the methods and tests employed specific to this file. The third section, "Contact Information," contains the contact information of the NIDCR (National Institute of Dental and Craniofacial Research) project officer for data users who wish to obtain additional and detailed information relating to lab methods, analyses, and references.

General Information

The analysis of NHANES III periodontal pathogen antibody data must be conducted using the key survey design and basic demographic variables. The NHANES III Household Adult Questionnaire Data File (ages 17 years and older) and Youth Questionnaire Data File (ages 16 and under) contains demographic data, health indicators, oral health status indicators, and other related information collected during household interviews. They also contain all survey design variables and sample weights for these age groups. The NHANES III Oral Health Examination Data File (ages 2 years and older) contains the dentist's examination detailing a variety of oral-facial assessments. Information relating to periodontal conditions such as pocket depth, loss of attachment, the presence of calculus and bleeding, and other related conditions were collected on individuals ages 13 years and older. These files may be linked to the periodontal pathogen antibody file using the unique survey participant (sample person) identifier (SEQN).

Scope of Data Release

Only Phase 2 (1991-94) surplus sera were tested for antibodies to *Actinobacillus actinomycetemcomitans* and *Porphyromonas gingivalis* in NHANES III and the titer results are contained in this data release. Consequently, when analyzing these antibody data, the MEC Phase 2 sample weight should be used (WTPFEX2) to calculate prevalence estimates and the design variables the pseudo-PSU (SDPPSU2) and the pseudo-stratum (SDPSTRA2) should be used to calculate the variance around an estimate. For more information on the use of sample weights in NHANES III data analysis, refer to the NHANES III Analytical and Reporting Guidelines (U.S. DHHS, 1996). In addition to the observed antibody titer level data, variables for both *A. actinomycetemcomitans* and *P. gingivalis* identifying a sample person as either "positive", "negative", or "equivalent" for exposure as established by current guidelines supported by the National Institute of Dental and Craniofacial Research are released.

Surplus Sera Collection

NHANES III collected blood from sample participants to perform numerous assays. Because of the possibility of out-of-range results that need to be repeated, more blood volume was collected than is usually needed for the assays to be performed. Since most sampled participants did not have out-of-range results, surplus serum specimens have been stored.

Periodontal Pathogen Collection

Surplus sera from Phase 2 of the survey (1991-1994) were tested for antibodies to *Actinobacillus actinomycetemcomitans* and *Porphyromonas gingivalis* in NHANES III by the National Institute of Dental and Craniofacial Research (NIDCR) to determine the seroprevalence of high antibody titer for these periodontal pathogens. Sera were tested on sample persons aged 12 years or older. An Enzyme-linked Immunoassay (ELISA) for (IgG) antibodies against protective antigen (PA) for *Actinobacillus actinomycetemcomitans* (Aa) and *Porphyromonas gingivalis* (Pg) was performed by NIDCR through a lab contractor. The NIDCR was responsible for monitoring quality control issues and reporting final values to NCHS.

The NIDCR lab contractor performed the tests to determine the positive cutoff values for both Aa and Pg. The NCHS has provided an Aa and Pg exposure variable derived from the values provided by NIDCR for this public release of data. The results of these tests provided information to NIDCR, which led to the establishment of the following value ranges for Aa and Pg exposure:

Pathogen Exposure Value Range

Actinobacillus actinomycetemcomitans (Aa) Negative 46-79
Equivalent 80-132
Positive 133-1994
Porphyromonas gingivalis (Pg) Negative 40-139
Equivalent 140-154
Positive 155-22885

Data Description, Codes and Notes

Variable Name Status Variable Label

Variable Field

DEPAA O A. actinomycetemcomitans (Aa)46-1994
antibody level

DEPPG O P. Gingivalis (Pg) antibody level 40-22885

DEPAAPOS D A. Actinomycetemcomitans (Aa) Positive

1=Yes

2=No

3=Equivalent

DEPPGPOS D P. Gingivalis (Pg) positive

1=Yes

2=No

3=Equivalent

Notes:

O = Observed lab value

D = Derived data

Contact Information

For detailed information regarding lab methods, analyses, and final determination of cut-points for exposure to these periodontal pathogens, contact should be made with the NIDCR project officer for NHANES:
