## Questionnaire Section: Reproductive Health (RHQ\_D)

First Published: December 2007

Last Revised: NA

---

### Component Description

This section contains questions for women only on reproductive health including menstrual history, pregnancy history, lactation, oral contraceptive and hormone replacement therapy use and other related conditions. Several questions were new in 2005, some questions were slightly modified, and others were omitted (see Analytic notes).

### Eligible Sample

Female mobile exam center (MEC) participants, 12 years and older were eligible.

### Interview Setting and Mode of Administration

These questions were asked at the Mobile Examination Center (MEC), during the MEC Interview, using the computer-assisted personal interviewing (CAPI) system.

### Quality Assurance & Quality Control

Approximately 5% of the interviews were recorded and reviewed for quality control purposes.

### Data Processing and Editing

The reproductive health questionnaire is a complex, detailed set of questions that includes the administration of questions according to age group or skip patterns based on responses to various reproductive health conditions. While data were reviewed and edited for completeness and illogical values, some inconsistencies in the response to the self-reported questions remain. Data analysts are strongly encouraged to carefully review all variables of interest prior to data analysis.

### Analytic Notes

New and modified variables, and excluded variables from RHQ\_C 2003-4 data release:

New:

RHQ166: Number of vaginal deliveries

RHQ169: Number of Caesarian deliveries.

RHQ171: Number of deliveries resulting in a live birth (modification of

RHD170: Number of pregnancies resulting in live birth)

Excluded:

RHQ700, and RHQ710A-G: Feminine hygiene products used in past month.

RHQ720: Douche in past 6 months

RHQ730: Frequency of douching in past 6 months

#### Notes about specific variables:

RHD080: Days since last period. Women who reported having had a menstrual period in the past 2 months were asked to report the date of their last menstrual period. The derived variable was created by subtracting the number of days between the reported month and day the period began and the date of the MEC interview. Please note that for this variable extreme values were retained and should be carefully examined prior to analysis.

There are several instances of women who reported that they were currently menstruating (RHQ051) who provided a date which may indicate that they were reporting a date that was not their most recent period but the one previous to that one.

RHQ171: Number of deliveries resulting in a live birth. If the total number of deliveries resulting in live births was greater than 11, the number was top coded to 11 for the purpose of confidentiality. Note: there are six cases where the number of deliveries resulting in a live birth is greater than the number of pregnancies reported in RHQ160. This may have occurred as a result of women reporting multiple lives births as in the case of twins rather than as single "deliveries."

RHQ180: Age at first live birth. If a woman only had one live birth (RHQ171=1), the age at the time of that live birth is reported in RHQ190 (age at last live birth).

RHQ291: Age when had hysterectomy Please note that there are 14 instances in which women reported an age of hysterectomy that is earlier than the age of last menstrual period (RHQ060).

Please refer to the Analytic Guidelines for further details on the use of sample weights and other analytic issues. The Analytic Guidelines are available on the NHANES website.
