Public Use Data Tape Documentation

Medical History, Ages 12-74 Years
Tape Number 5020

National Health and Nutrition Examination Survey, 1976-80

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES
Public Health Service
National Center for Health Statistics

Hyattsville, Maryland
May 1985

The data compilation and documentation necessary for the Medical History Data Tape were done by Michael Rowland, Mary Dudley, Dorothy Blodgett, Marie Leahy, Patricia Vaive, William Kitching, Deloris Leeper, and Wilbur Hadden of the Division of Health Examination Statistics, National Center for Health Statistics. A special note of gratitude is due Sandra Payne and Romaine Sharp who patiently typed this material.

The micro-data tapes for all examination components will be released as soon as the data have been validated and documented. It is anticipated at this time that release will occur sequentially from July 1981-December 1983. NHANES II data tapes will be available for purchase from:

National Technical Information Service (NTIS)

5285 Port Royal Road

Springfield, Virginia 22161

(703) 487-4650

A current listing of NCHS data tapes available for purchase from NTIS is available from:

Scientific and Technical Information Branch

I. BACKGROUND

A. National Health and Nutrition Examination Survey, 1976-1980 (NHANES II)

Description of Survey: NHANES II was one of a series of population based surveys designed to help determine the health status of the Nation. Data were collected through response to questionnaires on medical history, food consumption, and health-related behavior. Data also were collected through direct medical examination. The tape documented here contains data from the demographic and medical history parts of the survey. A detailed description of the design, content, questionnaires, and operation of NHANES II is provided in the following report: Plan and Operation of the Second Health and Nutrition Examination Survey, 1976-1980, DHHS Pub. No. (PHS) 81-1317, Series 1, No. 15, Public Health Service, Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. The stock number is 017-022-00752-5 and the cost is \$6.50. One copy is provided with the documentation herein, and a general summary of the data collection techniques and content is given in Appendix A.

Target Population: NHANES II was conducted on a nationwide probability sample of approximately 28,000 persons, ages 6 months-74 years, from the civilian, noninstitutionalized population of the United States. The survey started in February 1976 and was completed in February 1980. The NHANES II sample was selected so that certain population groups thought to be at high risk of malnutrition (persons with low incomes, preschool children, and the elderly) were oversampled. Adjusted sampling weights were then computed for 76 age, sex, and race categories in order to inflate the sample in such a manner as to closely reflect the estimated civilian noninstitutionalized U.S. population ages 6 months-74 years at the midpoint of the survey (March 1, 1978).

B. Use of NHANES Data

National Center for Health Statistics requests the cooperation of recipients of data tapes in certain actions related to their use:

1. Any publication based on the data should acknowledge NCHS as the original source. It should include a disclaimer which credits the authors for any analyses, interpretations, or conclusions, and not NCHS, which is responsible only for the data.
2. Consumers who wish to publish a technical description of the data should make a reasonable effort to insure that the description is not inconsistent with that published by NCHS. This does not mean, however, that NCHS will review such descriptions.
3. NCHS would appreciate receiving reprints of journal articles or other publications based upon findings from the NHANES II survey. Please forward copies to:

Division of Health Examination Statistics
National Center for Health Statistics
Center Building, Room 2-58,
3700 East-West Highway
Hyattsville, Maryland 20782

C. Editing of the Data Sets

The data users' tapes have been subjected to a great deal of careful editing. Some of the continuous data items have extremely high or low values and it has been verified that they do in fact appear that way on the original interview documents; that is, it has been verified that the values have not been incorrectly keyed. Within each data tape numerous consistency checks have been performed. However, due to the large volume of data collected in the survey, it is likely that a small number of errors or discrepancies remain undetected. The Division of Health Examination Statistics, NCHS would appreciate if any such errors are detected that they be brought to our attention so that errata sheets can be issued to previous purchasers and corrections made if new data tapes are created.

D. Use of Sample Weights

NHANES II uses a multistage sample designed to represent the civilian noninstitutionalized population of the United States, 6 months-74 years of age. Since the sample is not a simple random one, it is necessary to incorporate the person's sample weight for proper analysis of the data. The sample weight is a composite of the individual selection probability, adjustments for nonresponse, and poststratification adjustments.

NHANES II provides information on 20,322 individuals who were both interviewed and examined, and on another 4,964 individuals who were interviewed but not examined, in the age range 6 months to 74 years. In addition to the general examination components, several more detailed examinations were performed on subsamples of the population. Therefore, instead of there being one sample weight per person, there are several sample weights for each person. For a person not selected for a particular subsample, the associated subsample weight is zero. When analyzing the special subsamples, the analyst must be careful to select the appropriate sampling weight from the weights found in tape locations 282-317. For a more complete description of how the sample weights are calculated, see the detailed note section of this documentation. This file contains data on all 18,447 interviewed persons ages 12-74 years.

E. Sample Design, Variance Estimation, and Hypothesis Testing

The data collected in the Second National Health and Nutrition Examination Survey (NHANES II) were obtained through a complex sample design involving both clustering and stratification. Because of the complex design and the ratio adjustments applied to the sample weights (see previous section on use of sample weights), the direct application of standard statistical analysis methods for variance estimation and hypothesis testing may be very misleading. The modification of statistical analysis procedures to incorporate the effects of complex survey designs is an important area of research; however, the current methodologies appropriate for the analysis of data from such surveys have not been made readily available in the standard packaged statistical software.

There are computer programs available which do provide the capability of variance estimation for complex sample designs. The balanced repeated replication approach ¹ is utilized in &REPERR &PSALMS to calculate the variance-covariance matrix. Both routines are available within the OSIRIS IV library.² SESUDAAN, SURREGR³ and SUPERCARP⁴ are programs that calculate the variance-covariance matrix using the linearization approach ⁵ (Taylor series expansion).

In order to provide the user with the capability of estimating the complex sample variances in the NHANES II data using the above

procedures, we have provided Strata and Pseudo Primary Sampling Unit (PSU) codes on all data tapes in positions 324-326. These variables and the sample weights are necessary for the calculation of variances.

Even though the overall number of examined persons in this survey is quite large for statistical inference purposes, subclass analyses can lead to estimators that are unstable, particularly estimates of variances. Consequently, analyses of subclasses require that the user pay particular attention to the coefficient of variation for the estimates of means, proportions and totals. In addition, small sample sizes, or a small number of PSU's used in the variance calculations may produce unstable estimates of the variances using the above computer programs.

An NCHS Series 2 publication discusses these issues and an analytic strategy when examining various hypotheses for the first National Health and Nutrition Examination Survey (NHANES I) which used a similar type of complex sample design.⁶

II. GENERAL NOTES

Medical History, Ages 12-74 Years

A. Demographic Information

An advance letter, announcing the forthcoming arrival of an interviewer from the U.S. Bureau of the Census, was mailed to each household that fell into the NHANES II probability sample. The interviewer subsequently visited the household to ascertain its composition and to administer a questionnaire, the primary purpose of which was to obtain demographic information. The questionnaire was administered to a person in each household that was available and competent enough to respond to questions. In the event that a household member was not at home at the time of interview, any responsible adult in the household was asked to respond to the demographic questions for the absent person.

B. Medical History (Ages 12-74) Data Collection: Sample persons were selected from the household roster according to a set protocol. For each sample person medical history was administered in the home by an interviewer from the U.S. Bureau of the Census. After completing the medical histories for sample persons in a household the interviewer scheduled appointments for those willing to receive medical examinations at a mobile examination site. Questionnaire data not only provided information against which examination findings could be referred but also made possible the analysis of the characteristics of respondents and nonrespondents to the examination phase of the study. This information is valuable in assessing possible bias in examination findings due to nonresponse.

In addition to assessment of nonresponse bias, economy of operation and validity of responses were considerations. Time spent interviewing in the home meant more time devoted solely to examination procedures at the exam site.

An NCHS Series 1 publication describes the complete operational protocol including questionnaires for the survey.⁷

C. Medical History Data Editing: Preliminary editing was done of the interview forms by the Census Bureau and then delivered to the Center on tape. Center personnel verified and corrected to the extent possible problematic data and did further edits for consistency, completeness, and accuracy of the data against microfilm records of the original questionnaire where needed.

D. Other Medical History Data: Sample persons answered additional medical history questions in the examination center. On the Health History Supplement - Ages 12-74 Years (catalog number 5305 in preparation) and the Behavior Questionnaire - Ages 25-74 years (catalog number 5317 in preparation). The Health History Supplement included items on cardiovascular conditions, arthritis (stressing middle and upper back and neck problems), exposure to pesticides, teenage smoking, kidney and bladder disease, activity limitation, and menstrual and pregnancy history for females. The Behavior Questionnaire elicited data on behavior possibly associated with increased risk of coronary heart disease events.

III. TAPE CHARACTERISTICS AND DESCRIPTION

A. Tape Characteristics

Title: Medical History, Ages 12-74 Years
Catalog Number: 5020
Data Set Name: HEHANES2.DU502001
Record Length: 1160
Blocksize: 3480
Density: 1600 BPI
Number of Records: 18,447
Number of Reels: 1
Recording Mode: Fixed Block, EBCDIC
Channel: 9 Track
Created by: Division of Health Examination Statistics
National Center for Health Statistics
Hyattsville, Maryland

B. Index to Tape Positions

Medical History, Ages 12-74 Years Tape Summary

Catalog Number 5020

Section 1 - Demographic Data

	<u>Tape Positions</u>
Sample Sequence Number	1-5
Catalog Number (5371-for Demographic Data only)	6-9
Data user work area	10
Size of place	11
SMSA-non SMSA	12
Data user work area	13-23
Type of living quarters	24
Land usage	25
If rural, asked does this place have 10 acres or more?	26
If 10 acres or more, asked if in the last 12 months did sales of farm produce and livestock amount to \$50 or more?	27
If less than 10 acres, asked if in the last 12 months did sales of farm produce and live stock amount to \$250 or more?	28
Data user work area	29
Total number of persons in household	30-31
Total number of sample persons in household	32-33

Sample Person Data

Data user work area	34
Family relationship	35
Examination status	36
Family unit number	37-41
Data user work area	42-44
Age-months (at interview)	45-46
Age-years (at interview)	47-48
Data user work area	49-50
Date of birth-month	51-52
Date of birth-year	53-54
Sex	55
Race	56
In what state was he/she born?	57-58
Is he/she married, widowed, divorced, separated or never married?	59
Natural origin or ancestry	60-61
Education level	62-63
Grade completed	64
What was he/she doing during most of the past 12 months?	65
What was he/she doing?	66
Did he/she work at a job or business at any time during the past three months?	67
Did he/she work full or part-time when working?	68

Demographic Data (Cont.)

Tape Positions

Was he/she working within last two weeks not counting work around the house?	69
Even though he/she did not work, does he/she have a job or business?	70
Was he/she looking for work or on layoff from a job?	71
Which - looking for work or on layoff from a job?	72
What kind of industry or business is this?	73-75
What kind of work was he/she doing?	76-78
Was he/she in private company or business or working for individual for wages, salary or commission?	79
Did he/she ever serve in the armed forces of the U.S.?	80
When did he/she serve?	81
Data user work area	82-90

Household Data

How many rooms are in this ...? Count the kitchen, but not the bath	91
How many bedrooms are in this ...?	92
Ask only of unrelated household members. Do you have complete kitchen facilities in your living quarters, that is a kitchen sink with piped water, a refrigerator and a range or cookstove?	93
Do you have access to complete kitchen facilities in this house?	94
Do you have access to a range or cookstove?	95
Do you have access to a refrigerator?	96
Do you have access to a sink with piped water?	97
Is there piped water in this house (these living quarters)?	98
Is there both hot and cold water?	99
Are these kitchen facilities used by anyone not living in this household?	100
What is the main type of heating system you have?	101-102
Do you have air conditioning?	103
How many motor vehicles are owned or regularly used for transportation by members of your family?	104
Is any language other than English spoken by family members living here?	105
What language?	106
Which of these income groups represents your total combined family income for the past 12 months?	107-108

Demographic Data (Cont.)

Tape Positions

During the past 12 months, how much money did you and all members of your family receive in wages or salaries before deductions (under \$7,000 only)?	109-112
Social security or railroad retirement?	113
Data user work area	114
If yes, how much?	115-118
Welfare payments or other public assistance?	119
Data user work area	120
If yes, how much?	121-124
Unemployment compensation or workmen's compensation?	125
Data user work area	126
If yes, how much?	127-130
Government employee pension or private pensions?	131
Data user work area	132
If yes, how much?	133-136
Dividends, interest or rent?	137
Data user work area	138
If yes, how much?	139-142
Net income from their own business (nonfarm) professional practice, or partnership?	143
Data user work area	144
If yes, how much?	145-148
Net income from a farm?	149
Data user work area	150
If yes, how much?	151-154
Veteran's payments?	155
Data user work area	156
If yes, how much?	157-160
Alimony, child support or other support from persons not in household?	161
Data user work area	162
If yes, how much?	163-166
Any other income?	167
Data user work area	168
If yes, how much?	169-172
Total amount	173-176
Check Item B - Food stamps available	177
Are you certified to participate in the food stamp program?	178
Are you buying food stamps now?	179
What is the main reason you are not participating in the program?	180
Are you certified for commodity distribution program?	181

Demographic Data (Cont.)

Tape Positions

Are you receiving commodity foods now for your family?	182
Why aren't you participating in the program?	183

C. Tape Description

Demographic Data

Use of Special Terms

The term "data user work area" refers to blank areas in the data tape which are reserved for the user as needed.

The term "blank, but applicable", is used to indicate a data item that was to have a response for a sample person but none was given. The terms "blank" and "Not applicable" refer to data items where the sample person was not supposed to respond to the question or receive the examination component.

To understand more fully the questionnaire skip patterns and the categorizations used, see the Plan and Operation of the Second National Health and Nutrition Examination Survey document included with this documentation.⁷ All the questionnaires are included in this document.

DETAILED NOTES
TAPE POSITION 11

Size of Place

Size of place classification was derived from the 1970 census. According to the definition used in the 1970 census, the urban population was comprised of all persons living in (a) places of 2,500 inhabitants or more incorporated as cities, boroughs (except Alaska), villages and towns (except towns in New York, New England States, and Wisconsin), but excluding those persons living in the rural portions of extended cities; (b) unincorporated places of 2,500 inhabitants or more; and (c) other territories included in urbanized areas. The remaining population was classified as rural.

Urban areas are further classified by population size for places within urbanized areas and other places outside urbanized areas.

DETAILED NOTES

TAPE POSITION 12

SMSA

Except in New England, a Standard Metropolitan Statistical Area is basically a county or a group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to the 1970 census, they are socially and economically integrated with the central city. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. In New England, SMSA's consist of towns and cities, rather than counties.

TAPE POSITIONS 37-41

Family Unit Code

All related sample persons in the same family unit have the same computer-generated family unit code. This will enable analysis of individual family units.

DETAILED NOTES

TAPE POSITIONS 56, 206, and 256

Race

The race of the respondent was marked by observation and the interviewers were instructed to assume the race of all related persons was the same as the respondent unless otherwise learned. The race categories were "White", "Black" or "Other". If the appropriate category could not be marked by observation, then race was asked. Interviewers were instructed to record persons who responded with something other than White or Black, such as Japanese, Chinese, American Indian, Korean, Hindu, Eskimo, etc. as "Other"; and to include Mexicans, Puerto Ricans and other persons of Latin American descent in "White" unless definitely Black, American Indian, or of other nonwhite race.

DETAILED NOTES

TAPE POSITIONS 73-75, 76-78, 273-275 and 276-278

Industry and Occupation Codes

Occupation may be defined as the principal job or business. For this survey, the principal job or business of a respondent is defined in one of the following ways: if the person worked during the two week interview period or had a job or business, the question concerning occupation (or work) applies to the job during that period. If the respondent held more than one job, the question is directed to the one at which the most time was spent. It refers to the one considered most important when equal time is spent at each job. A person who has not begun work at a new job, is looking for work, or is on layoff from work is questioned about the last full-time civilian job. A full-time job is defined as one at which the person spent 35 or more hours per week and which lasted two consecutive weeks or more. A person who has a job but has not yet reported to it or a person who has never had a job or business is classified as a "new worker".

The 1970 census of population Alphabetical Index of Industries and Occupations was used in the coding of both the industry and occupation. Library of Congress Number 74-612012. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Stock Number 0301-2283.

DETAILED NOTES
TAPE POSITIONS 107-108

Family Income Group

The respondent was handed a card with twelve income ranges listed as Group A to Group L and asked "Which of these income groups represents your total combined family income for the past 12 months, that is, yours, your ...'s, etc? Include income from all sources such as wages, salaries, social security or retirement benefits, help from relatives, rent from property and so forth."

If the respondent answered Group A through G, that is with an income less than \$7,000, then questions 21 and 22 detailing exact sources and amounts of income were asked; otherwise, these questions were skipped.

No effort was made to reconcile amounts reported in detailed questions 21 and 22 with the categorical response to the family income group question. During the survey time period no adjustments to the income groups or \$7,000 value were made to account for inflation.

DETAILED NOTES

TAPE POSITION 207

Land used for farming purposes (Code 1 in Tape Position 207) was identified as being either 1) rural land (Code 2 in Tape Position 25) consisting of 10 or more acres (Code 1 in Tape Position 26) with crop sales amounting to \$50 or more (Code 1 in Tape Position 27), or 2) rural land (Code 2 in Tape Position 25) consisting of less than 10 acres (Code 2 in Tape Position 26) with crop sales amounting to \$250 or more (Code 1 in Tape Position 28). All other rural land is classified as nonfarm (Code 2 in Tape Position 207).

DETAILED NOTES
TAPE POSITION 209

Region

The United States was divided into four broad geographic regions of approximately equal population. Those regions, which deviate somewhat from the groups used by the Bureau of Census, are as follows:

<u>Region</u>	<u>States Included</u>
Northeast	Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, and Pennsylvania
South	Delaware, Maryland, District of Columbia, West Virginia, Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Arkansas
Midwest	Ohio, Illinois, Indiana, Michigan, Wisconsin, Minnesota, Iowa, Missouri
West	Washington, Oregon, California, Nevada, New Mexico, Arizona, Texas, Oklahoma, Kansas, Nebraska, North Dakota, South Dakota, Idaho, Utah, Colorado, Montana, Wyoming, Alaska, Hawaii

DETAILED NOTES
TAPE POSITIONS 210-212

Poverty Index

Income status was determined by the Poverty Income Ratio (PIR). Poverty statistics published in the Census Bureau reports ¹⁻⁵ were based on the poverty index developed by the Social Security Administration (SSA) in 1964. (For a detailed discussion of the SSA poverty standards, see reference 6.) Modifications in the definition of poverty were adopted in 1969. ⁷ The standard data series in poverty for statistical use by all executive departments and establishments has been established. ⁸

The two components of the PIR are the total income of the household (numerator: the median of the income group for incomes \$7,000 and above; the sum of the component parts of the income questions for incomes under \$7,000) and a multiple of the total income necessary to maintain a family with given characteristics on a nutritionally adequate food plan ³ (denominator). The dollar value of the denominator of the PIR is constructed from a food plan (economy plan) necessary to maintain minimum recommended daily nutritional requirements. The economy plan is designated by the U.S. Department of Agriculture for "emergency or temporary use when funds are low."

For families of three or more persons, the poverty level was set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was adjusted by the relatively higher fixed expenses of these smaller households.

The denominator or poverty income cutoff adjusts the family poverty income maintenance requirements by the family size, the sex of the family head, the age of the family head in families with one or two members, and the place of residence (farm, nonfarm). Annual revisions of the poverty income cutoffs are based on the changes in the average cost of living as reflected in the Consumer Price Index.

As shown in the tables, the annual income considered to be the poverty level increases as the family size increases. A family with any combination of characteristics and with the same income as shown in the table has been designated as having a PIR or poverty level of 1.0. The same family with twice the income found in the table would have a PIR of 2.0. Ratios of less than 1.0 can be described as "below poverty" and ratios greater than or equal to 1.0, as "at or above poverty".

Poverty thresholds are computed on a national basis only. No attempt has been made to adjust these thresholds for regional, State, or other

variations in the cost of living (except for the farm, nonfarm difference). None of the noncash public welfare benefits such as food stamp bonuses are included in the income of the low income families receiving these benefits. PIR has been adjusted by year (see tables) and accounts in some part for inflation.

Detailed Notes
Tape Positions 282-323

A multistage estimation procedure was used to calculate the various NHANES II subsample sample weights that are necessary to use in any analysis of the data. The procedure has three basic components:

1) inflation by reciprocals of the probabilities of selection, 2) adjustment for nonresponse, and 3) poststratification ratio adjustment by age-sex-race. A brief description of each component is as follows:

Inflation by reciprocals of the sampling probabilities. Since the survey utilized a three-stage sample design, there were three probabilities of selection: 1) the probability of selecting the PSU, 2) the probability of selecting a segment (housing unit), and 3) the probability of selecting a sample person.

Adjustment for nonresponse. Estimates from the NHANES II data were adjusted to account for sample persons who were not examined. The estimates were inflated by a multiplication factor calculated within five selected income groups, three age groups, four regions, and standard metropolitan statistical area (SMSA) or non-SMSA. The numerator of these factors was the sum of the weights for sample persons resulting from the reciprocal of the probability of selection, and the denominator was the sum of the weights for examined persons also resulting from the reciprocals of the sampling probabilities.

Poststratification by age-sex-race. The estimates were ratio adjusted within each of 76 age-sex-race cells to an independent estimate, provided by the U.S. Bureau of the Census, of the population of each cell as of March 1, 1978, (approximate mid-point of the survey). The ratio adjustment was a multiplication factor of which the numerator was the U.S. population and the denominator was the sum of the weights adjusted for nonresponse for examined persons. This ratio estimation process makes the sample more closely representative of the civilian, noninstitutionalized population of the U.S.

Potential bias of nonresponse. Usually a sizeable number of sample persons who initially are willing to complete the household information and some of the medical history questionnaire subsequently will not participate in the examination. This creates the potential for bias if these persons differ from other sample persons with respect to the variables being studied. Intense efforts were undertaken during NHANES II to develop and implement standard procedures and inducements that would reduce the number of nonrespondents and thereby reduce the potential for bias.

The user needs to be aware of and should explore the potential bias for nonresponse in any analysis of the NHANES II data.

DETAILED NOTES

Tape Positions 701-710

These fields contain data on the number of respondents' siblings, living and dead, who had diabetes and on the respondents' birth order.

The number of siblings with diabetes was checked to see if it was less than or equal to the number of siblings living or dead. In two cases it was not; but that is what respondents said and no other data are available to correct their answers. Also, the number of siblings born before the respondent was checked to see if it was less than or equal to the total number of siblings. In many cases it was not. Perhaps in those cases where it was one greater, respondents were the youngest and were including themselves in the count. Again, data are not available to correct these errors and the data user may feel the need to impute or delete these cases.

DETAILED NOTES

Tape Position 719-720

This field is the age at which a doctor first told sample persons they were diabetic. It was compared with the sample person's age at the time of survey and duration of therapies for diabetes, insulin, pills, and diet. Some persons reported being told they were diabetic at too young an age or too long before the survey for it to be believed that they could have gone without therapy for as long as the data imply.

These data are presented as given by the respondents (not processing errors). The data user may evaluate them differently.

DETAILED NOTES

Tape Position 1160

The term "Dummy Record" refers to a tape record for a respondent who was included in the sample but for whom no Medical History Questionnaire was received. Although demographic data are available for all respondents, positions 405-1159 are all blank in dummy records, and position 1160 contains a code of "1" to identify such records. If position 1160 contains the code "blank", at least some Medical History Questionnaire data were received for that respondent.

IV. APPENDIX

Data Collection Techniques and Content

The plan developed with respect to the content of NHANES II called for the following:

A. Questionnaires completed in the household:

(1) Household questionnaire: For each household member, questions referred to family relationships; certain demographic items such as age, sex, and race; selected housing information; occupation, income, education, veteran status; and an indication of participation in food stamp programs.

(2) Medical history questionnaires:

(a) For each sample person ages 6 months-11 years

The questionnaire included items on birth weight, prematurity, congenital conditions, medication, neurological conditions, lead poisoning, accidents, hospital care, disability, diarrhea, pica, vision, and a variety of chronic conditions. In addition, data were collected on allergies, kidney and bladder disease, anemia, speech and hearing, lung and chest conditions and participation in food programs.

(b) For each sample person ages 12-74 years

The questionnaire included items on medication; hospital care, tuberculosis; a variety of acute and chronic diseases; tobacco usage, physical activity; weight; height; vision disability, exposure to pesticides; gastrointestinal

problems; and for females, a menstrual and pregnancy history. In addition, data were collected on anemia, diabetes, respiratory condition, hearing and speech, liver and gallbladder conditions, kidney and bladder disease, allergies, hypertension, cardiovascular conditions, stroke, arthritis (stressing middle and upper back and neck problems), and participation in food programs.

B. Questionnaires and tests administered in the mobile examination center:

(1) Dietary Questionnaires

- (a) For each examined person, a 24-Hour Recall was administered by trained dietary interviewers. Specific and quantitative detail of every food or drink consumed during the previous day was recorded and calculated, thus providing estimates of calories, protein, carbohydrates, fat, unsaturated fats, cholesterol, and specific vitamins and minerals consumed.
- (b) For each examined person, a Food Frequency interview was administered to ascertain usual patterns of food consumption. Daily and/or weekly consumption of foods within 26 subgroups were recorded. In addition, data were collected on usual vitamin-mineral supplement usage.
- (c) For each person ages 12-74 years, a Dietary Supplement form was self-administered and reviewed. This form provided information on special diets, recent medications and barriers to purchasing groceries or eating foods; it does not provide information on vitamin/mineral or other supplements to the diet.

- (2) Medication/Vitamin Usage Form provided information on the past week's usage of any medicines; vitamins or minerals for all examined persons.
- (3) Behavior Questionnaire elicited data on behavior which may be associated with coronary heart disease for examined persons ages 25-74.

C. Examination by physician

A physician performed and recorded the results of a medical examination giving special attention to specified findings related to nutrition, to hearing, to the thyroid gland, and to the cardiovascular, respiratory, neurological and musculoskeletal systems.

D. Special clinical procedures and tests

A specially trained health technician carried out the following on examined persons in the designated age ranges:

- (1) Spirometry trials of examined persons ages 6-24 years, were digitized and recorded on magnetic tape. Various pulmonary function indicators such as FVC (forced vital capacity), FEV₁ (forced expiratory volume in one second), and peak flow rate were subsequently derived from these data.
- (2) Electrocardiograms Electrocardiographic signals of examined persons ages 25-74 years were digitized and recorded on magnetic tape providing normative data of amplitude, duration, interval and axis measurements and permitting interpretations of heart disease according to the Minnesota classification code.

- (3) Body Measurements were made on all examinees and included standing height, body weight, triceps and subscapular skinfolds, and several other anthropometric measurements.
- (4) Puretone audiometry tests were carried out on examined persons between the ages of 4 and 19 years, permitting determination of threshold levels of hearing for frequencies of 500, 1000, 2000, and 4000 Hertz for right and left ears.
- (5) Speech recording, involving use of tape recording of the subject's repetition of specially developed sentences, was carried out on examined persons between the ages of 4 and 6 years, permitting interpretations as an indication of problems with articulation and language development.
- (6) Allergy tests, involving skin tests (prick test) with eight common allergens (housedust, alternaria, cat fur, dog fur, ragweed, oak, rye grass, and Bermuda grass). The tests were made on examined persons between the ages of 6 and 74 years, to obtain degrees of skin reaction.

E. X-rays

For examined persons ages 25-74 years, two x-rays were made. No x-rays were taken of pregnant women and no lumbar x-rays were taken on women under 50 years of age.

- (1) X-ray of cervical and lumbar spine were taken to provide evidence of osteoarthritis and degenerative disc disease, and

- (2) X-ray of chest, to be used in the diagnosis of respiratory diseases and to serve as a measure of left ventricular enlargement.

F. Urine tests

Tests as follows were performed on casual samples of urine:

- (1) N-Multistix tests for qualitative protein, glucose, ketones, bilirubin, blood, urobilinogen, pH, and bacteriuria (nitrite test) were done for examined persons ages 6-74 years.
- (2) Urinary sediments, including red cells, white cells, and casts, were measured for a subsample of examined adults ages 20-74 years.
- (3) Gonorrhea cultures, of urinary sediments were performed for male and female examined persons ages 12-40 years. However, of those females who received the Glucose Tolerance Test (GTT) only those ages 20-24 years had the gonorrhea test performed.
- (4) Analyses for pesticide residue and metabolite levels were carried out on a subsample of examined persons ages 12-74 years, including measures of the body burdens from exposure to alkyl phosphate residues and metabolites, carbamate residues, phenolic compound residues and malathion metabolites.

G. Tests on blood samples

Samples of blood provide a broad range of information related to health and nutrition. The particular tests performed varied with the specific target condition and age group as described on page 39 of the Series 1, No. 15 program description.⁷

(1) Glucose tolerance test (GTT)

This test involved collection of blood specimens while in a fasting state as well as at one and two hours after glucose challenge. The test was performed on a specified subsample of examined adults to provide estimates of the prevalence of diabetes.

(2) Tests related to liver function

(a) Post-prandial liver bile acid test. This test measures the ability of the liver to remove bile acids from the blood following consumption of a food preparation which induces eventual addition of bile acids to the blood via contraction of the gallbladder.

(b) Liver biochemistries performed include bilirubin, SGOT, and alkaline phosphatase tests.

(3) Anemia-related laboratory tests

The tests made to characterize anemia consisted of protoporphyrin, iron, total iron binding capacity (TIBC), zinc, copper, red cell folates, serum folates, serum ferritin, B₁₂, and the determination of abnormal hemoglobin.

(4) Other nutritional biochemistries

These tests include albumin, Vitamin A, and Vitamin C.

(5) Serum lipids

Because of their important relevance to cardiovascular disease, determinations were made of cholesterol, triglycerides, and high density lipoprotein (HDL).

(6) Biochemistries for body burden from environmental exposures

Determinations were made of body burden levels of lead and pesticide residues and metabolites. Tests were also performed for carboxyhemoglobin which reflects environmental exposure to carbon monoxide and the individual's smoking habits.

(7) Hematology

The hematology included determinations of hemoglobin, hematocrit, red blood cell count, white blood cell count and differential leukocyte analysis, and red blood cell morphology and hemoglobin phenotyping.

(8) Kidney function

The only quantitative test for kidney function performed on blood samples was the serum creatinine test.

(9) Syphilis

The serology determinations for syphilis included qualitative and quantitative ART, a FTA-ABS and MHA-TP.
