Chapter I. Introduction

The purpose of this contextual data file is to provide an array of community characteristics by which researchers may investigate contextual influences for the fertility-related behaviors studied by the *National Survey of Family Growth, Cycle 6: 2002-2003* (NSFG-6). The first of two contextual data files produced by ICPSR for NSFG-6, it contains selected characteristics of the communities in which the NSFG-6 respondents resided when they were interviewed for NSFG-6 during 2002-2003. In contrast, the second file comprises characteristics of the communities in which the NSFG-6 respondents lived on April 1, 2000. The second contextual data file has the same variables as this one, plus two more which show whether the respondent was at the same address on April 1, 2000 (MOVER), and if not, the type of geocoding match for the respondent's address on that date (MATCH).

More than a thousand contextual variables have been compiled and calculated from various sources at the state, county, census tract, and block group level. Characteristics covered by the contextual variables include sex, age, race, Hispanic origin, marital status, migration, household type and presence of children, income and poverty, education and school enrollment, labor force participation and work hours, building permits, housing occupancy, housing tenure, housing values and rent, nursing and personal care facilities, Medicare program enrollment, crime, private nonfarm business establishments, manufacturing, wholesale and retail trade, government programs and finances, and the presence of services and facilities for contraception and sexually transmitted diseases.

The codebook comprises four chapters and an appendix. The first chapter contains an overview of the contextual data file and describes its missing value codes. Next, variable descriptions are provided in Chapter II, including the formulas that were used to compute the contextual variables from the original data sources. Chapter III describes the original data sources and explains how the contextual variables were named while Chapter IV contains descriptive statistics for every numeric variable in the contextual data file: number of valid cases, number of missing cases, mean, standard deviation, minimum value, and maximum value.¹ Finally, Appendix A consists of notes on three constructed measures that were too complex to be covered in Chapter II.

For examples of the uses of these data, see the following report which was based on the NSFG Cycle 5 Contextual Data File:

William Mosher, Lionel Deang, and Mathew Bramlett. "Community Environment and Women's Health Outcomes: Contextual Data." *Vital and Health Statistics, Series 23, No. 23*, April 2003. Hyattsville, MD: National Center for Health Statistics.

Structure of the NSFG-6 Contextual File

¹ The minimum and maximum values, however, have been omitted from this version of the codebook due to disclosure risk. They are included in the unedited codebooks available in the NCHS Research Data Center.

Supplied as a portable SAS CPORT file named *nsfg6c02.cpt*, this contextual data file can be converted to a SAS dataset with the SAS CIMPORT procedure.

The contextual data file contains 12,571 cases, one for each of the 12,571 NSFG-6 respondents.

There are 1,052 variables in the contextual data file, all of which are numeric except the first seven which are character variables. The NSFG-6 respondent identification number (CASEID), respondent's gender (RESP_GENDER), and five geographic identification variables (SRC_BLOCK, STATE, COUNTY, TRACT, and BLKGRP) constitute the character variables. With a few exceptions, the numeric variables consist of various rates, proportions, means, medians, and absolute numbers. About one third of the variables in the contextual data file were computed from variables in the original sources; the others are copies of variables in the original sources. Every variable in the contextual data file has a variable label with a detailed description of the variable.

By matching on the common ID variable CASEID, the contextual data file can be merged with the main NSFG-6 survey data.

Data Sources and Levels of Observation

The 1,052 variables in the contextual data file were derived from the following sources:

- NSFG-6 survey data
- *Census of Population and Housing, 2000: Summary File 3 (SF3)*
- *County and City Data Book, 2000 (CCDB)*
- A data file with variables on contraception and abortion that was prepared by the Alan Guttmacher Institute (AGI).
- A data file with variables on sexually transmitted diseases that was prepared by the Centers for Disease Control and Prevention (CDC)
- *Census of Population and Housing, 2000: Special Tabulation STP23 (STP23)*, which was submitted to ICPSR by the Alan Guttmacher Institute
- *2004 Green Book, Background Material and Data on the Programs within the Jurisdiction of the Committee on Ways and Means (GB)*

Three variables were derived from the NSFG-6 survey data, 620 were derived from STF3, 101 from CCDB, 33 from the AGI file, seven from the CDC file, 280 from STP23, and eight from GB.

Multiple levels of observation are represented by the contextual variables. The variables derived from SF3 consist of 232 county level variables, 206 census tract level variables, 178 block group level variables, and four variables with geographic codes which identify the state, county, census tract, and block group. Two of the three variables originating in the NSFG-6 survey data (CASEID and RESP_GENDER) are respondent level variables and one (SRC_BLOCK) contains a geographic code which uniquely identifies the block group. All of the variables

derived from GB are state level variables and all of variables originating in CCDB, the AGI file, the CDC file, and STP23 are county level variables.

Missing Values

This NFSG-6 contextual data file contains 17 missing value codes: the SAS numeric missing value and 16 SAS special numeric missing values. The SAS numeric missing value is a period (.) and the special numeric missing values are .A, .B, .C, .D, .E, .F, .G, .I, .J, .N, .Q, .R, .S, .V, .Y, and .Z.

Numeric missing value. This missing value code was generated during the computation of variables AGIr1 to AGIr17, a subset of the variables derived from the AGI file. It indicates that division by zero was attempted when a variable was calculated.

Special numeric missing value .R. Reserved for contextual variables originating from the Green Book, .R indicates that a GB table cell had an entry of “NA” (not available) or a state was completely missing from a GB table.

Special numeric missing value .S. Of the 16 special numeric missing value codes, .S is the most widely used. It denotes an estimated proportion, rate, mean, or median based on an unacceptably small sample size. Many of the variables in the contextual data file are based on sample data rather than complete enumerations. For the most part, the sample data was collected by the Census 2000 long-form questionnaire, which was administered to one in six household residents overall. Confidence that an estimate reflects an actual population value declines as the size of the sample from which it is calculated becomes smaller. To prevent the use of unreliable estimates based on very small sample sizes, every variable in the contextual data file that is an estimate of a proportion, rate, or mean was recoded to .S if the estimated size of its denominator was smaller than one of two thresholds: 70 for dichotomous variables and 170 for all other variables. To the same end, medians based on an estimated population size less than 170 were also recoded to .S. Applying the overall sampling fraction of 1/6 to an estimate of 170 gives a sample size of about 28 and an estimate of 70 implies a sample size of about 12.

Only variables that are estimates of a proportion, rate, mean, or median were subjected to this missing value recode. Variables that are estimates of absolute numbers (e.g., population counts) were never recoded to .S, regardless of their size.

Variables with more than 6,000 of the 12,571 cases coded .S were removed from the NFSG-6 contextual data file altogether.

Other special numeric missing values. These missing value codes, which are described in Table 1-1 on the next page, indicate that a value in the *County and City Data Book, 2000* was problematic for one of the following reasons:

1. a range of values was supplied in CCDB instead of a single value

2. a value was withheld in CCDB to avoid disclosure pertaining to a specific organization or individual
3. a value was missing in CCDB because it was “not enumerated, tabulated, or otherwise available separately”
4. a value in CCDB contained an aggregate figure for a number of counties or county equivalents
5. a value was omitted from CCDB because it “would amount to less than half the unit of measurement shown”

Table 1-1. Missing Values in CCDB Variables

Missing Value Code	Description
.A	0 to 19 employees
.B	20 to 99 employees
.C	100 to 249 employees
.D	Figure withheld to avoid disclosure pertaining to a specific organization or individual
.E	250 to 499 employees
.F	500 to 999 employees
.G	1,000 to 2,499 employees
.I	5,000 to 9,999 employees
.J	10,000 to 24,999 employees
.N	Data not enumerated, tabulated, or otherwise available separately
.Q	Less than 10 employees
.V	XXXXXXXXXXXXXXXXXXXXXXXXXXXX
.Y	XXXXXXXXXXXXXXXXXXXXXXXXXXXX
.Z	Entry would amount to less than half the unit of measurement shown

Chapter II. Variable Descriptions

Chapter II describes all of the NSFG-6 contextual variables, which are listed according to their order in the contextual data file. The name of each variable is presented together with a description of the variable and the formula that was used to compute it. Except for the contextual variables derived from the Green Book, SGB00460 to SGB02657, and some of the contextual variables derived from STP23, mar100_S1 to unmar250_S5, the formulas are given in terms of variables in the original data sources. The former exceptions are defined in terms of GB table columns and the latter in terms of other variables in the contextual data file. In the formulas the SF3 variables are identified by their names in ICPSR's SAS, SPSS, and Stata setups for SF3 while the other variables are identified by their original names in the data sources. Chapter III contains a crosswalk between the ICPSR setup names and the variable names (data dictionary reference names) used in the original SF3 Census Bureau documentation.

Chapter III. Source Documentation and Variable Naming Conventions

This chapter describes the data sources that were used to construct the NSFG-6 contextual variables and explains how the contextual variables were named.

Census of Population and Housing, 2000: Summary File 3

Summary File 3 contains detailed tabulations of population and housing characteristics generated from the 2000 decennial census. It contains 813 tables, one variable per table cell (16,603 variables in all), that provide information on sex, age, race, Hispanic origin, marital status, migration, year moved into residence, education, labor force participation, unemployment, income in 1999, poverty status, occupation, industry, household type, housing value, plumbing facilities, year structure built, and other characteristics. The tables are presented for the nation and manifold subdivisions of the nation down to the block group. Derived from the 2000 Census long-form questionnaire which, overall, was sent to approximately 1/6 of the housing units in the United States, variables in SF3 are based on sample data that have been weighed up to represent the total population.

Three different methods were used to name the contextual variables derived from SF3.

I. Variables C_AREALAND to B_H76_1 were named by prepending “C_,” “T_,” or “B_” to the variable names used in ICPSR’s SAS, SPSS, and Stata setups for SF3 (e.g. see *Census of Population and Housing, 2000 [United States]: Selected Subsets from Summary File 3* (ICPSR 13402)). “C_” denotes county level variables, “T_” tract level variables, and “B_” block group level variables .

II. Variables STATE, COUNTY, and BLKGRP have the same names as in ICPSR’s SF3 setups.

III. Variables CST00001 to BST00377, which constitute most of the SF3 variables, were named according to the convention that was used in the NSFG Cycle 5 contextual data file. These variable names have eight characters. The first character identifies the level of observation, “C” for county, “T” for tract, and “B” for block group. The next four characters contain the string “ST00” which identifies the data source and the year of the source: “ST” denotes SF3 and “00” the year 2000. A three digit sequence number completes the variable name. If a variable had a counterpart or an approximate counterpart in the NSFG Cycle 5 contextual data file, then it was assigned the same sequence number as in Cycle 5. Variables without a counterpart in Cycle 5 were arbitrarily assigned a sequence number from 601 to 656.

In Chapter II, the contextual variables are defined as functions of the original SF3 variables, which are identified by their names in ICPSR’s SF3 setups. Table 3-1 contains a crosswalk between the variable names shown in the formulas in chapter II and the names (data dictionary reference names) used in the Census Bureau’s technical documentation for SF3.

County and City Data Book, 2000 (CCDB)

The *County and City Data Book, 2000* contains a broad range of statistical information, made available by federal agencies and national associations, for the nation, states, counties, cities with 25,000 or more persons, and places with 2,500 or more persons. Data are provided in multiple formats including Excel spreadsheets. The county level information is presented as 13 tables:

- B-1. Area and Population
- B-2. Population by Age, Sex, and Race
- B-3. Group Quarters Population and Households
- B-4. Vital Statistics and Health
- B-5. Education, Income, and Poverty
- B-6. Crime, Housing, and Building Permits
- B-7. Labor Force and Private Business Establishments and Employment
- B-8. Personal Income and Earnings
- B-9. Manufacturing and Water Use
- B-10. Farm Population, Farm Earnings, and Agriculture
- B-11. Wholesale Trade and Retail Trade
- B-12. Accommodation and Foodservices, Banking, and Federal Funds
- B-13. Government Programs, Employment, and Finances

NSFG-VI contextual variables derived from CCDB have the same names as in the original Excel spreadsheets, except that hyphens in the original variable names (which are not allowed in SAS) were replaced by underscores. The variable names begin with two or three letters which identify the CCDB county table.

Missing values in the original Excel spreadsheets are denoted by footnotes, which were converted to SAS special missing value codes in the contextual data file. See Chapter I for a description of these missing value codes.

Alan Guttmacher Institute Data File

The AGI file contains variables on abortion and contraception collected by the Alan Guttmacher Institute. Keeping their original variable names, the AGI variables were copied as is to the contextual data file.

Table 3-2. Variables in the AGI File

Variable Name	Description
abrate	Grouped abortion rate per 1,000 women aged 15-44
abhosp	Any hospital abortion provider in 2000? (0=no; 1=yes)
abclinic	Any clinic abortion provider in 2000? (0=no; 1=yes)
abphys	Any other physician abortion provider in 2000? (0=no; 1=yes)
abany	Any abortion provider in 2000? (0=no; 1=yes)
abany400	Any provider of 400 or more abortions in 2000? (0=no; 1=yes)
win1319	Women aged 13-19 in need of contraceptive services and supplies, 2000
win2044	Women aged 20-44 in need of contraceptive services and supplies, 2000
winpoor	Women aged 20-44 at less than 250% of federal poverty level in need of contraceptive services and supplies, 2000
fppvdrs	Total number of publicly supported family planning providers, 2001
fpcllt20	Female clients under age 20 of publicly supported family planning providers, 2001
fpclge20	Female clients aged 20+ of publicly supported family planning providers, 2001
popf1344	Female population aged 13-44, 2000
popf1544	Female population aged 15-44, 2000
popf1519	Female population aged 15-19, 2000
popf2044	Female population aged 20-44, 2000

As recommended by the Alan Guttmacher Institute, 17 indices were computed from the variables in the AGI file. The indices were arbitrarily assigned the names AGIr1 to AGIr17.

Centers for Disease Control and Prevention Data File

A file with variables on sexually transmitted diseases was prepared by the Centers for Disease Control and Prevention.

Table 3-3. Variables in the CDC file

Variable Name	Description
GCCASE	Gonorrhea (GC) cases, 2000
CTCASE	Chlamydia (CT) cases, 2000
PSCASE	Primary and secondary syphilis cases, 2000
TOTPOP	Population for STD rates, 2000
CTRATE	Chlamydia (CT) rate per 100,000 population, 2000
GCRATE	Gonorrhea (GC) rate per 100,000 population, 2000
PSRATE	Primary and secondary syphilis rate per 100,000 population, 2000

The data on gonorrhea, chlamydia, and syphilis were obtained from the National Electronic Telecommunications System for Surveillance (NETSS), a computerized public health surveillance information system that provides the Centers for Disease Control and Prevention with weekly data regarding cases of nationally notifiable diseases. The original variable names in the CDC file were retained in the contextual data file.

Census of Population and Housing, 2000: Special Tabulation STP23

Supplied to ICPSR by the Alan Guttmacher Institute, STP23 is a special county level tabulation of Census 2000 data prepared by the Census Bureau. The STP23 data file contains counts of persons aged 10-49 cross-classified by sex, seven age groups, four race and Hispanic origin groups, five income groups, and two marital status groups.

STP23 Age Groups

1. 10-14
2. 15-17
3. 18-19
4. 20-24
5. 25-29
6. 30-44
7. 45-49

STP23 Race and Hispanic Origin Groups

1. Not Hispanic or Latino, white alone
2. Not Hispanic or Latino, black alone
3. Not Hispanic or Latino, Asian or other race
4. Hispanic or Latino

STP23 Income Groups

1. Income below the poverty level
2. Income 100-132% of the poverty level
3. Income 133-184% of the poverty level
4. Income 185-249% of the poverty level
5. Income 250% or more of the poverty level

STP23 Marital Status Groups

1. Married, spouse present
2. All other marital statuses

STP23 has one variable for each of the ten combinations of income and marital status.

Table 3-4. STP23 Variables

STP23 Variable Name	Description
mar100	Married, spouse present, income below the poverty level
mar132	Married, spouse present, income 100-132% of the poverty level
mar184	Married, spouse present, income 133-184% of the poverty level
mar249	Married, spouse present, income 185-249% of the poverty level
mar250	Married, spouse present, income 250% or more of the poverty level
unmar100	Other marital status, income below the poverty level
unmar132	Other marital status, income 100-132% of the poverty level
unmar184	Other marital status, income 133-184% of the poverty level
unmar249	Other marital status, income 185-249% of the poverty level
unmar250	Other marital status, income 250% or more of the poverty level

For every county, there are 56 iterations of the 10 STP23 variables (56 cases per county), one for each combination of sex, age, and race/Hispanic origin.

The contextual data file contains copies of selected STF23 variables (variables mar100_221 to unmar250_274) and selected sums of those variables (variables mar100_S1 to unmar250_S5). Variables copied from the STP23 file were named by appending an underscore and three digits to the original STP23 variable names. As shown in Table 3-5, the digits indicate the sex, age, and race/Hispanic origin groups represented by the variables. Table 3-5 excludes males and persons aged 10-14 because those groups were not included in the contextual data file.

Table 3-5. Last Three Digits of Copied STP23 Variable Names

Group	First Digit
Females	2
	Second Digit
Ages 15-17	2
Ages 18-19	3
Ages 20-24	4
Ages 25-29	5

Ages 30-44	6
Ages 45-49	7
	Third Digit
Not Hispanic or Latino, white alone	1
Not Hispanic or Latino, black alone	2
Not Hispanic or Latino, Asian/other race	3
Hispanic or Latino	4

Contextual variables that are sums of STP23 variables were named by appending to the original STP23 variable name an underscore, the letter S, and a digit which signifies one of four summary groups:

1. Females aged 15-44 not Hispanic or Latino, white alone
2. Females aged 15-44 not Hispanic or Latino, black alone
4. Females aged 15-44 Hispanic or Latino
5. Females aged 15-44 of all races

2004 Green Book

Compiled by the staff of the Committee on Ways and Means of the United States House of Representatives, the *2000 Green Book* provides program descriptions and historical data on a wide variety of social and economic topics, including Social Security, employment, earnings, welfare, child support, health insurance, the elderly, families with children, poverty, and taxation.

As shown in Chapter II, data from following tables in the Green Book were incorporated into the contextual data file:

Table 4-5--Amount and Duration of Weekly Benefits for Total Unemployment under the Regular State Programs

Table 7-7--AFDC/TANF Families, Monthly Average, Fiscal Years 1994-2002

Table 7-9--Average Monthly Benefit for AFDC/TANF Families, Selected Fiscal Years 1994-2002

Table 7-13 -- Maximum AFDC/TANF Benefit for a Family Of Three (Parent with Two Children) July 1970 - January 2003

Table 7-16 -- TANF Phase-Out Points -- Monthly Earnings Limit for Continued Eligibility, Single-Parent Family with Two Children, January 1, 2003

Like most of the variables derived from SF3, the contextual variables derived from the Green Book were named according to the convention used in the NSFG Cycle 5 contextual data file. Every variable name has eight characters: the first character denotes the level of observation, the next two characters the data source, characters 4-5 the last two digits of the year, and the last three characters contain a three digit sequence number. Accordingly, each variable name begins with "S" which indicates the state level of observation and characters 2-3 are always "GB" which signifies the Green Book. Six of the eight variables derived from GB were assigned the same sequence number as their counterparts or approximate counterparts in the NSFG Cycle 5 contextual data file. The other two variables, which do not have counterparts or approximate counterparts in the Cycle 5 contextual data file, were arbitrarily assigned the sequence number 657.

The SAS special missing value .R was assigned to the variables when a GB table cell had an entry of "NA" (not available) or a state was completely missing from a table.

Appendix A. Constructed Measures

Appendix A contains notes on three constructed variables that were too complex to be described in Chapter II.

1. Variable METRO12 (Metropolitan (MSA/CMSA) status of block group)

Based on the SF3 variables MACCI and MSACMSA, METRO12 indicates whether a block group was within one of the twelve largest metropolitan areas in 2000, a different metropolitan area, or a non-metropolitan area, and if it was in a metropolitan area, whether it was in a central city or a suburb. Metropolitan Statistical Areas (MSA) and Consolidated Metropolitan Statistical Areas (CMSA) constitute the metropolitan areas, which are identified by unique MSA/CMSA codes assigned to variable MSACMSA. Together with their MSACMSA codes, the twelve largest metropolitan areas are listed in Table A-1. The other SF3 variable MACCI shows if a

MSA/ CMSA Code	Rank	Area Name	Population April 1, 2000
5602	1	New York--Northern New Jersey--Long Island, NY--NJ--CT--PA CMSA	21,199,865
4472	2	Los Angeles--Riverside--Orange County, CA CMSA	16,373,645

2162	8	Detroit--Ann Arbor--Flint, MI CMSA	5,456,428
1922	9	Dallas--Fort Worth, TX CMSA	5,221,801
3362	10	Houston--Galveston--Brazoria, TX CMSA	4,669,571
0520	11	Atlanta, GA MSA	4,112,198
4992	12	Miami--Fort Lauderdale, FL CMSA	3,876,380

block group was in a central city of a metropolitan area, in a suburb of a metropolitan area, or in a non-metropolitan area. Its coding scheme is presented in Table A-2.

Table A-2. MACCI Codes

Code	Description
Y	Geographic unit is within a central city of a metropolitan area
N	Geographic unit is within a metropolitan area but not within a central city
9	Geographic unit is not within a metropolitan area

METRO12 was computed as follows:

If MACCI equals Y and MSACMSA equals the MSA/CMSA code of one the twelve largest metropolitan areas, then METRO12=1

If MACCI equals Y and MSACMSA does not equal the MSA/CMSA code of one the twelve largest metropolitan areas, then METRO12=2

If MACCI equals N and MSACMSA equals the MSA/CMSA code of one the twelve largest metropolitan areas, then METRO12=3

If MACCI equals N and MSACMSA does not equal the MSA/CMSA code of one the twelve largest metropolitan areas, then METRO12=4

If MACCI equals 9 then METRO12=5

In instances where a metropolitan block group straddled a central city-suburb boundary so that it was partially in a central city and partially in a suburb, METRO12 was assigned a central city code, i.e., code 1 or 2 depending on the value of MSACMSA.

2. Variable CST00246 (Median 1999 household income for households with householder Asian and other races – county)

This median was estimated using Pareto interpolation for grouped data:

$$\text{Median} = \exp(M_{lb} + [p*(M_{ub} - M_{lb})])$$

where M_{ub} is the logarithm of the upper bound of the category containing the median, M_{lb} is the logarithm of the lower bound of this category, and p is the proportion of the population bounded by M_{ub} and M_{lb} that lies at or below the median.

If the median fell in the final open-ended interval of the income distribution (\$200,000 or more), CST00246 was equated to 200,001. If it fell in the lowest income interval (less than \$10,000), CST00246 was equated to 9,999.

3. Variable CST00319 (Female Labor Force Opportunity Index, 2000 – county)

The Female Labor Force Opportunity Index measures the expected number of jobs for female workers relative to the potential supply of female workers, taking into account the sex-segregated nature of the labor market. Following Nakamura et al. (1979), it is defined as

$$\sum p_i w_i / F$$

were w_i is the number of workers in the county who are in occupation category i , p_i is the national proportion of workers in occupation category i who are female, and F is the potential supply of women workers expressed as the number of women in the county aged 16 and older .¹
