IPC for Marburg Virus Disease(MVD): Preventing MVD from Entering Your Healthcare Facility

Healthcare Settings with Limited to Intermediate Resources

Updated: March 2023

Learning Objectives

After this presentation, participants will be able to

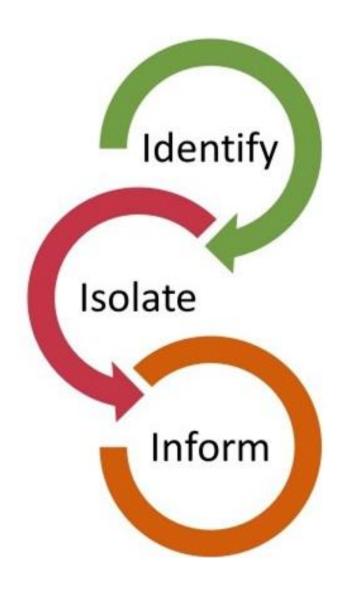

- Name the 3 key strategies to prevent introduction Marburg virus disease into health facilities
- Explain why screening for Marburg virus disease is important
- Describe best practices for screening for Marburg virus disease

Discuss

Why is it important to identify people who might have Marburg virus disease before they enter your healthcare facility?

Key Strategies to Prevent Introduction of Marburg virus disease in Health Facilities:

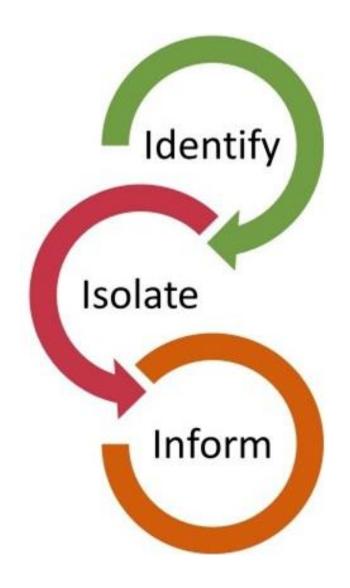

- Identify
- Isolate
- Inform

Identify

Screening is the process of identifying patients who might be infectious so that they can be promptly isolated and referred for testing and care at a facility intended for that purpose.

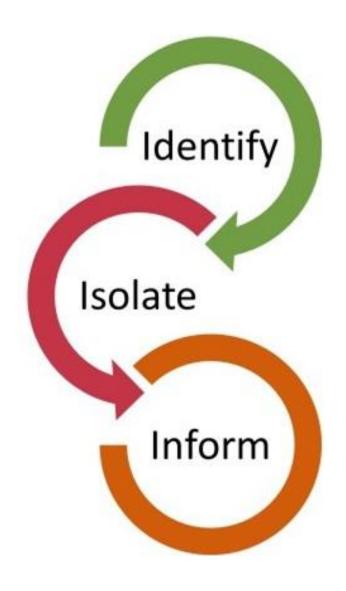

Screening should take place at the point of entry prior to entering a healthcare facility.

Isolate and Inform

When a suspect Marburg virus disease patient is identified:

- <u>Isolate</u> the patient immediately. Explain the situation and next steps to the patient.
- <u>Inform</u> the designated physician or head nurse
 - Physician or head nurse will verify and ensure isolation measures are in place
 - Physician or head nurse communicates the alert to appropriate phone number

Early identification and separation of suspected Marburg virus disease patients prevents bringing unrecognized Marburg virus disease into your healthcare setting.

This protects...
YOU
Your patients
Your community

Screening Basics

Key Points for Screening for Marburg Virus Disease

- Screen everyone entering a facility
 - Patients, healthcare workers, accompanying family members, etc.
- Screen before any patient care activities. This can be:
 - Upon entrance to a facility (e.g. a main gate)
 - During patient registration (e.g. a registration desk or office)
 - As additional layer, during check-in to wards (e.g. maternity)
- Always assume that a patient might be infectious and <u>use standard</u> <u>precautions*</u> for ALL patients ALL the time

^{*} Infection prevention and control practices are applied to all patients based on the principle that all blood, body fluids, secretion, excretion, nonintact skin, and mucous membrane may contain transmissible infectious agent

Screening Safety

- Maintain distance (at least 1 meter per WHO recommendation)
 - If at least 1 meter cannot be maintained, wear PPE (gloves, gown, goggles, face mask)
- Avoid direct face-to-face interaction
 - angle chairs away from each other
 - place plexiglass between screener and person being screened
- Perform hand hygiene often

Screening Involves Two Parts:

- Temperature check
- Questionnaire: signs and symptoms + risk factors in past 21 days

Screening Process

Explain

Example: "To keep everyone safe, we are screening for Marburg virus disease. We will take your temperature and ask a few questions."

Take temperature

Non-contact (infrared) thermometer

Follow questions on screening tool (symptoms, exposures)

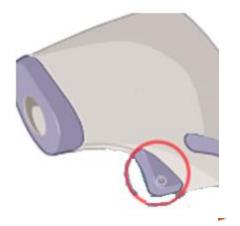

Take action

Does the person meet case definition for suspect Marburg virus disease case?

- If YES, escort to isolation area
- If NO, they may enter the facility

Non-contact Temperature Check

1 Turn on the thermometer

Instructions vary for different types/brands of infrared thermometers.

Always check the package insert or instructions on the manufacturer's website.

Allow 15 minutes for device to warm up

(this allows for thermometer to acclimate to the temperature of the environment around it)

Confirm thermometer has correct settings (e.g., Celsius, 'body' reading instead of 'object')

Non-contact Temperature Check (continued)

- Stand to side of person whose temperature is being taken
- Ask person to push back hair or head scarf, remove hat or glasses, and wipe off perspiration (perspiration in pores can lead to a lower temperature reading)

- Aim for the temple, above the end of the eyebrow (NOT the forehead)
- Hold thermometer 3-5cm from person's temple (about width of 3 fingers) and press button

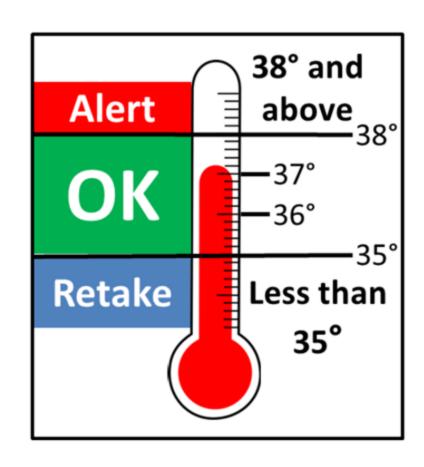

Non-contact Temperature Check (continued)

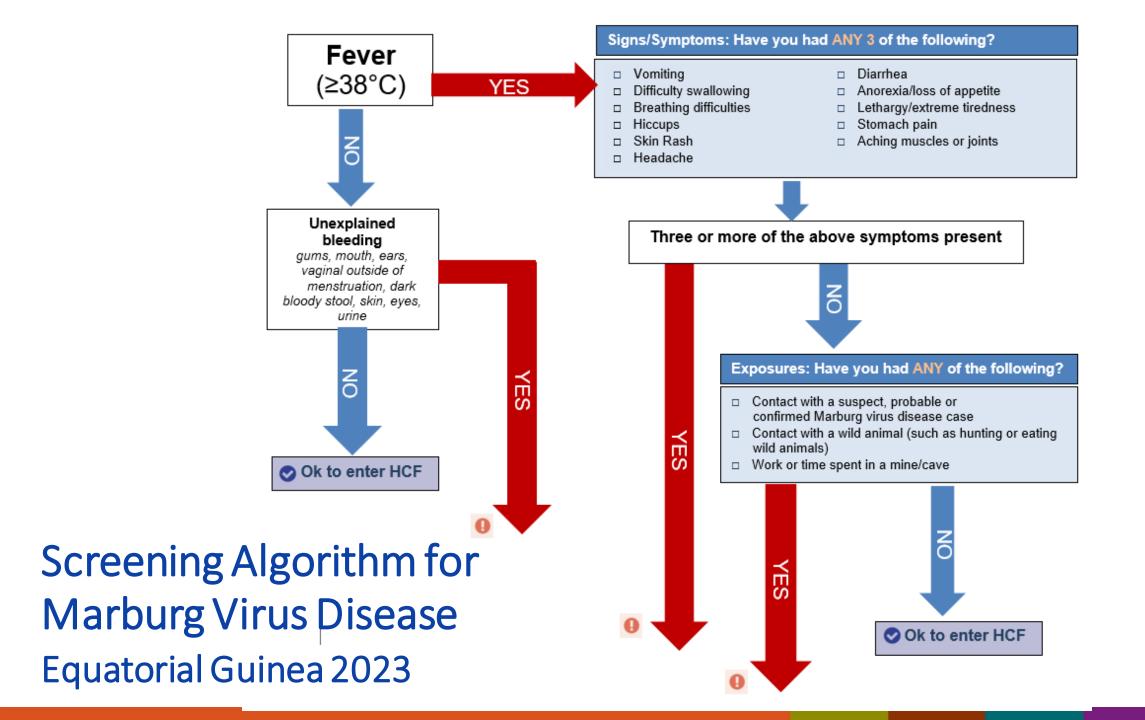

8

Read thermometer screen

- If less than 35°C, take again
- If 38°C or higher, fever indicated

Screening Equipment and Supplies

- Screening stations should have:
 - Print-out of screening algorithm for reference
 - Patient register
 - Infrared (non-contact) thermometer
 - Thermometer batteries/back-up thermometer
 - PPE if distance cannot be maintained

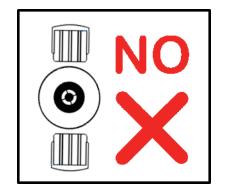

Knowledge Check

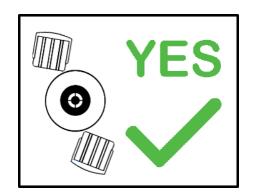

Imagine you see your co-worker screening someone entering your facility like this. What suggestions would you give them to help them screen more safely?

Feedback: Screening

- PPE should be based on risk assessment
- Maintain a distance of at least 1 meter or place barrier such as plexiglass
- Avoid being face-to-face
- Point thermometer closer to person's forehead or temple (depending on thermometer instructions)

Reflection

How is the process of screening for Marburg virus disease similar to or different from screening processes you have followed in the past?

What challenges have you encountered in the past with screening? If you have never had to participate in screening, what challenges do you imagine you might have?

Key Takeaways

To protect yourself, your patients, and your loved ones...

Identify

Isolate

Inform

Thank you!
