

## Receipt of influenza vaccination

**Figure 4.1. Percentage of adults aged 18 and over who received an influenza vaccination during the past 12 months, by age group and quarter: United States, 1997–2013**

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. • National Health Interview Survey (NHIS) questions related to influenza vaccination have changed since 1997. Starting in 1997, respondents were asked if they had received a flu shot during the past 12 months. Beginning in 2003, respondents were also asked if they had received a flu vaccine sprayed in their nose during the past 12 months. In August 2010, NHIS influenza vaccination questions were modified to reflect that, for the first time, the widely available influenza vaccine included protection against both seasonal and H1N1 types of influenza. • NHIS Early Release influenza vaccination estimates have changed since 1997. Starting in 1997, Early Release influenza vaccination estimates covered receipt of an influenza shot only. Starting in 2005, Early Release influenza vaccination estimates covered seasonal influenza shot and/or seasonal intranasal influenza vaccination. • Estimates based on data collected in quarters three and four of 2010 and one and two of 2011 could be affected, to an unknown extent, by reports of H1N1 immunization without seasonal flu immunization for the period when the two were administered separately (October 2009–May 2010). Prevalence of influenza vaccination during the past 12 months is different from season-specific coverage (see [http://www.cdc.gov/mmwr/preview/mmwrhtml/ss6204a1.htm?s\\_cid=ss6204a1\\_w](http://www.cdc.gov/mmwr/preview/mmwrhtml/ss6204a1.htm?s_cid=ss6204a1_w); estimates available from: <http://www.cdc.gov/flu/fluview>). • The recommendations of the Advisory Committee on Immunization Practices regarding who should receive an influenza vaccination have changed over the years, and changes in coverage estimates may reflect changes in recommendations (4–6). • An influenza vaccine shortage occurred during the 2004–2005 influenza season (4). Delays in the availability of influenza shots also occurred in fall 2000 and, to a lesser extent, in fall 2001 (4–7). • The analyses excluded those with unknown influenza vaccination status (about 3% of respondents each year). • See [Technical Notes](#) for more details.

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 1997–2013, Sample Adult Core component.

- In the fourth quarter of 2013, the percentage of adults who had received an influenza vaccination during the past 12 months was 63.7% for adults aged 65 and over, 44.6% for those aged 50–64, and 27.0% for those aged 18–49.
- For all three age groups, fourth-quarter estimates in 2013 were higher than, but not significantly different from, fourth-quarter estimates in 2012.

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 1997–2013, Sample Adult Core component.

- For 2013, the percentage of adults who had received an influenza vaccination during the past 12 months was 46.5% for persons aged 50–64 (Table 4.1a). This estimate was higher than the 2012 estimate of 42.7%.
- For 2013, the percentage of adults who had received an influenza vaccination during the past 12 months was 67.9% for persons aged 65 and over (Table 4.1b). This estimate was higher than, but not significantly different from, the 2012 estimate of 66.5%.
- For the age groups 50–64 and 65 and over, the percentage of adults who had received an influenza vaccination during the past 12 months increased from 1997 to 2013.

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. • Respondents were asked in separate questions if they had received a flu shot during the past 12 months or a flu vaccine sprayed in their nose during the past 12 months. These questions do not indicate whether the vaccination was a child’s first or second dose. In August 2010, National Health Interview Survey influenza vaccination questions were modified to reflect that, for the first time, the widely available influenza vaccine included protection against both seasonal and H1N1 types of influenza. When interpreting influenza vaccination estimates, readers should take into account changes made to the influenza vaccination questions noted above. • Estimates based on data collected in quarters one and two of 2011 could be affected, to an unknown extent, by reports of H1N1 immunization without seasonal flu immunization for the period when the two were administered separately (October 2009–May 2010). Prevalence of influenza vaccination during the past 12 months is different from season-specific coverage (see [http://www.cdc.gov/mmwr/preview/mmwrhtml/ss6204a1.htm?s\\_cid=ss6204a1\\_w](http://www.cdc.gov/mmwr/preview/mmwrhtml/ss6204a1.htm?s_cid=ss6204a1_w); estimates available from: <http://www.cdc.gov/flu/fluview>). • The recommendations of the Advisory Committee on Immunization Practices regarding who should receive an influenza vaccination have changed over the years, and changes in coverage estimates may reflect changes in recommendations (5,8). • The analyses excluded the 1.8% of persons with unknown influenza vaccination status. • See [Technical Notes](#) for more details.

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 2013, combined Sample Adult and Sample Child Core components.

- For both sexes combined, the percentage of persons who had received an influenza vaccination during the past 12 months was highest among persons aged 65 and over (67.9%), followed by persons aged 6 months–17 years (46.9%), 50–64 years (46.5%), and 18–49 years (29.6%).
- For persons aged 6 months and over and for adults aged 18–49 and 50–64, females were more likely than males to have received an influenza vaccination during the past 12 months.

DATA SOURCE: CDC/NCHS, National Health Interview Survey, 2013, combined Sample Adult and Sample Child Core components.

- For children aged 6 months–17 years, the percentage who had received an influenza vaccination during the past 12 months was 49.1% for Hispanic children, 45.1% for non-Hispanic white children, and 44.7% for non-Hispanic black children. Hispanic children were more likely to have received an influenza vaccination than were non-Hispanic white and non-Hispanic black children.
- For adults aged 18 and over, the percentage who had received an influenza vaccination during the past 12 months was lowest among Hispanic adults (28.9%), followed by non-Hispanic black adults (33.2%) and non-Hispanic white adults (44.8%).

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. Beginning with the 2012 data, the National Health Interview Survey transitioned to weights derived from the 2010 census. For 2003–2011 data, weights were derived from the 2000 census. In this Early Release, estimates for 2000–2002 were recalculated using weights derived from the 2000 census. For 1997–1999 data, weights were derived from the 1990 census. See [Technical Notes](#) for more details.
