

Tobacco

Description

Information collected regarding subjects' smoking status and the use of tobacco products. While study participants were not allowed alcohol or caffeine consumption during the evaluations, they were allowed to use tobacco products because abstaining could precipitate symptoms of withdrawal. In addition, participants were not permitted to smoke in the two hours preceding each saliva sample. Refer to the data codebook for the detailed information of each variable.

Study Sample

227 participants in the study had the tobacco information above collected.

Data Collection Method

Information was administered by clinician in paper-and-pencil format from arrival to departure at the clinic.
