ORAUT-OTIB-0070

Dose Reconstruction During Residual Radioactivity Periods at Atomic Weapons Employer Facilities

Report from the Procedures Review Subcommittee

Presented to the ABRWH Full Board meeting Augusta, Georgia

March 12, 2013

ORAUT-OTIB-0070 Summary

- Provides guidance for
 - Estimating dose to workers at Atomic Weapons
 Employer (AWE) facilities when NIOSH determines
 "significant residual contamination"
 - Reconstruction of internal doses due to the resuspension of particulate surface contamination
- Only internal and external radiation exposures defined in 42 U.S.C. §7384n(c)(4) are included in residual period dose reconstructions; exposure from commercial sources is not used

ORAUT-OTIB-0070 Timeline

- March 10, 2008 Revision 0
- August 29, 2008 SC&A Review (SCA-TR-TASK3-0009)
- July 14, 2010 NIOSH Initial Responses
- July 26, 2010 Discussed with Subcommittee
- December 30, 2010 SC&A Reply to NIOSH Responses
- January 5, 2012 2nd Discussion Agreed on Approach
- March 5, 2012 Revision 1
- July 31, 2012 3rd Discussion Findings Resolved

ORAUT-OTIB-0070, Revision 0

- Provides guidance for reconstruction of internal doses due to the resuspension of particulate surface contamination
- Recommends _
 - 6 methods for estimating internal exposure to residual radioactivity at AWE facilities depending on:
 - Type of data available (air sample or surface contamination)
 - Timing of data (operational and/or post-operational)
 - Resuspension factor of 1×10⁻⁶ m⁻¹, based on numerous studies from 1964 to 2002
 - Revision of 0.01 day-1 source term depletion rate to 0.00067 in Rev 1, based on data from 4 AWE sites

Findings Summary: OTIB-0070

- 15 Findings in total—complete histories captured in the Board Review System (BRS)
 - http://app-cinc-dcas.cdc.gov:8106/documents/ default.aspx?mode=ASSIGNED
 - Resolution spanned 4+years
 - 14 findings are Closed
 - 1 is Addressed in TBD-6000 (also Closed)
- The following slides provide summary information on resolution of each Finding – Details in BRS and handout

| # | Finding | Resolution |
|---|---|---|
| 1 | Inconsistent use of the resuspension factor (RF) – | Closed on July 31, 2012 |
| | The default source term depletion value of the 1% day ⁻¹ implies a RF of 8e-05 per meter, which is nearly 2 orders of magnitude higher than NIOSH's recommended RF of 10 ⁻⁶ m ⁻¹ . | OTIB-0070, Revision 1 changed the source term depletion rate from 1% day ⁻¹ to 0.00067 day ⁻¹ , which is consistent with a RF of 10 ⁻⁶ m ⁻¹ . |

| # | Finding | Resolution |
|---|---|--|
| 2 | OTIB-0070, Section 2.5 references Sehmel 1980, Till and Meyer 1983, Linsley 1978, and Healy 1971. All of these references are (except Healy 1971) to outdoor soil contamination, which involve conditions with little resemblance to building surfaces, building uses, room heights, and ventilation rates. | OTIB-0070, Revision 1 recalculated the default source-term depletion rate during the residual radiation periods based actual data from 4 AWE sites (Blockson, Dow Madison, General Atomics, and Simonds Saw) rather than being based on literature sources where outdoor measurements were preponderant. |

| # | Finding | Resolution |
|---|--|---|
| 3 | Implicit in deriving the source term depletion rate (λ, Section 2.6) is that airborne contaminants are (1) uniformly distributed throughout the interior volume and (2) removed with 100% efficiency. Neither assumption is likely to exist. | OTIB-0070, Revision 1, Section 4.1 recalculated the default source-term depletion rate during the residual radiation periods based on averaging observed depletion rates at four AWE sites. |

| # | Finding | Resolution |
|---|---|---|
| 4 | Battelle-TBDs-6000/6001 identified relatively large air | Closed on January 5, 2011 |
| | concentrations during facility operations that were job specific. In contrast, OTIB-0070, Attachment B identifies a single value for each of 3 thorium sites that excludes process air sampling data. | Air samples were selected to be indicative of general area conditions within the facilities at the start of the residual period and not potential exposure during the operational period. |

| # | Finding | Resolution |
|---|---|---|
| 5 | Attachment B cites survey data for 3 thorium facilities, but provides no further guidance on how these data sets are to be used. | Both Closed on January 5, 2011 Since it has never been used for DR purposes, Appendix B has been deemed unnecessary for the purpose of OTIB-0070, and has been |
| 6 | Use of Horizons' summary survey data as a default value for operational air concentration at a thorium refining facility is inappropriate and not claimant favorable. | removed from Revision 1. |

| # | Finding | Resolution |
|---|--|--|
| 7 | It is unclear how the Attachment B Horizons geometric mean value of 4.8 dpm/m³ was derived from the data contained in | Both Closed on January 5, 2011 Since it has never been used for DR purposes, |
| 8 | AEC 1955. The derivation of Appendix B air concentration values (i.e., a GM of 1.2 dpm/m³ and a GSD of 3.9 dpm/m³) for Nuclear Metals from AEC 1958 was not adequately explained. | Appendix B has been deemed unnecessary for the purpose of OTIB-0070, and has been removed from Revision 1. |
