

### Surgical Site Infection (SSI) Toolkit Activity C: ELC Prevention Collaboratives

S.I. Berríos-Torres, MD Division of Healthcare Quality Promotion Centers for Disease Control and Prevention

Draft - 12/21/09 --- Disclaimer: The findings and conclusions in this presentation are those of the authors and do not necessarily represent the views of the Centers for Disease Control and Prevention.

### Outline

#### • Background

- Impact
- HHS Prevention Targets
- Pathogenesis
- Epidemiology
- Prevention Strategies
  - Core
  - Supplemental
- Measurement
  - Process
  - Outcome
- Tools for Implementation/Resources/References

### SAFER • HEALTHIER • PEOPLE<sup>M</sup>

### **Background: Impact**

#### **Burden-US**

- ~300,000 SSIs/yr (17% of all HAI; second to UTI)
- 2%-5% of patients undergoing inpatient surgery

#### Mortality

- 3 % mortality
- 2-11 times higher risk of death
- 75% of deaths among patients with SSI are directly attributable to SSI

#### Morbidity

long-term disabilities

0

Anderson DJ, etal. Strategies to prevent surgical site infections in acute care hospitals. Infect Control Hosp Epidemiol 2008;29:S51-S61 for individual references

### **Background: Impact**

### Length of Hospital Stay

• ~7-10 additional postoperative hospital days

#### Cost

- \$3000-\$29,000/SSI depending on procedure & pathogen
- Up to \$10 billion annually
- Most estimates are based on inpatient costs at time of index operation and do not account for the additional costs of rehospitalization, post-discharge outpatient expenses, and long term disabilities

Anderson DJ, etal. Strategies to prevent surgical site infections in acute care hospitals. Infect Control Hosp Epidemiol 2008;29:S51-S61 for individual references

 Reduce the admission and readmission SSI Standardized Incidence Ratio (SIR) by at least 25% from baseline

– Outcome – SSI SIR

- 95% adherence rates to each SCIP/NQF infection process measure
  - Process Adherence to SCIP/NQF infection process measures

http://www.hhs.gov/ophs/initiatives/hai/prevtargets.html Appendix G

# Background: Pathogenesis Pathogen Sources

### Endogenous

- Patient flora
  - skin
  - mucous membranes
  - -GI tract
- Seeding from a distant focus of infection

### Exogenous

- Surgical Personnel (surgeon and team)
  - Soiled attire
  - Breaks in aseptic technique
  - Inadequate hand hygiene
- OR physical environment and ventilation
- Tools, equipment, materials brought to the operative field

#### Background: Pathogenesis Organisms Causing SSI January 2006-October 2007

Staphylococcus aureus	30.0%
Coagulase-negative staphylococci	13.7%
Enterococcus spp.	11.2%
Escherichia coli	9.6%
Pseudomonas aeruginosa	5.6%
Enterobacter spp	4.2%
Klebsiella pneumoniae	3.0%
Candida spp.	2.0%
Klebsiella oxytoca	0.7%
Acinetobacter baumannii	0.6%

N=7,025

Hidron AI, et.al., Infect Control Hosp Epidemiol 2008;29:996-1011 Hidron AI et.al., Infect Control Hosp Epidemiol 2009;30:107–107(ERRATUM)

#### Background: Epidemiology Emerging Challenges

### **Challenges in detecting SSIs**

- Lack of standardized methods for postdischarge/outpatient surveillance
  - Increased number of outpatient surgeries
  - Shorter postoperative inpatient stays

### **Antimicrobial Prophylaxis**

 Increasing trend toward resistant organisms may undermine the effectiveness of existing recommendations for antimicrobial prophylaxis

## Background: Epidemiology

- Antimicrobial prophylaxis
  - Inappropriate choice (procedure specific)
  - Improper timing (pre-incision dose)
  - Inadequate dose based on body mass index, procedures >3h, or increased blood loss
- Skin or site preparation ineffective
  - Removal of hair with razors
- Colorectal procedures
  - Inadequate bowel prep/antibiotics
  - Improper intraoperative temperature regulation

### SAFER • HEALTHIER • PEOPLE"

# Background: Epidemiology Additional Modifiable Risk Factors

- Excessive OR traffic
- Inadequate wound dressing protocol
- Improper glucose control
- Colonization with preexisting microorganisms
- Inadequate intraoperative oxygen levels

### **Prevention Strategies**

- Core Strategies
  - High levels of scientific evidence

FEROHEALTHI

 Demonstrated feasibility

- Supplemental Strategies
  - Some scientific evidence
  - Variable levels of feasibility

\*The Collaborative should at a minimum include core prevention strategies. Supplemental prevention strategies also may be used. Most core and supplemental strategies are based on HICPAC guidelines. Strategies that are not included in HICPAC guidelines will be noted by an asterisk (\*) after the strategy. HICPAC guidelines may be found at www.cdc.gov/hicpac

### Prevention Strategies: Core Preoperative Measures

# Administer antimicrobial prophylaxis in accordance with evidence based standards and guidelines

- Administer within 1 hour prior to incision\*
  - 2hr for vancomycin and fluoroquinolones
- Select appropriate agents on basis of
  - Surgical procedure
  - Most common SSI pathogens for the procedure
  - Published recommendations

\*Fry DE. Surgical Site Infections and the Surgical Care Improvement Project (SCIP): Evolution of National Quality Measures. Surg Infect 2008;9(6):579-84.

### SAFER • HEALTHIER • PEOPLE"

#### Prevention Strategies: Core Preoperative Measures

• Remote infections-whenever possible:

Identify and treat before elective operation

- Postpone operation until infection has resolved
- Do not remove hair at the operative site unless it will interfere with the operation; do not use razors
  - If necessary, remove by clipping or by use of a depilatory agent

**Prevention Strategies: Core** 

### **Preoperative Measures (continued)**

- Skin Prep
  - Use appropriate antiseptic agent and technique for skin preparation
- Maintain immediate postoperative normothermia\*
- Colorectal surgery patients
  - Mechanically prepare the colon (Enemas, cathartic agents)
  - Administer non-absorbable oral antimicrobial agents in divided doses on the day before the operation

\*Fry DE. Surgical Site Infections and the Surgical Care Improvement Project (SCIP): Evolution of National Quality Measures. Surg Infect 2008;9(6):579-84.

### SAFER • HEALTHIER • PEOPLE"

Prevention Strategies: Core Intraoperative Measures

### • Operating Room (OR) Traffic

- Keep OR doors closed during surgery except as needed for passage of equipment, personnel, and the patient

Prevention Strategies: Core Postoperative Measures

- Surgical Wound Dressing
  - Protect primary closure incisions with sterile dressing for 24-48 hrs post-op
- Control blood glucose level during the immediate post-operative period (cardiac)\*
  - Measure blood glucose level at 6AM on POD#1 and #2 with procedure day = POD#0
  - Maintain post-op blood glucose level at <200mg/dL</li>
- Discontinue antibiotics within 24hrs after surgery end time (48hrs for cardiac)\*

\*Fry DE. Surgical Site Infections and the Surgical Care Improvement Project (SCIP): Evolution of National Quality Measures. Surg Infect 2008;9(6):579-84.

- Nasal screen and decolonize only Staphylococcus aureus carriers undergoing elective cardiac and other procedures (i.e., orthopaedic, neurosurgery procedures with implants) with preoperative mupirocin therapy\*Bode LGM, etal. Preventing SSI in nasal carriers of Staph aureus. NEJM 2010;362:9-17
- Screen preoperative blood glucose levels and maintain tight glucose control POD#1 and POD#2 in patients undergoing select elective procedures (e.g., arthroplasties, spinal fusions)\*

NOTE: These supplemental strategies are not part of the 1999 HICPAC Guideline for Prevention of Surgical Site Infections

### SAFER • HEALTHIER • PEOPLE"

# Prevention Strategies: Supplemental **Perioperative**

- Redose antibiotic at the 3 hr interval in procedures with duration >3hrs (\* See exceptions to this recommendation in\*Engelman R, et al. The Society of Thoracic Surgeons Practice Guideline Series:Antibiotic Prophylaxis in Cardica Surgery, Part II:Antibiotic Choice. Ann Thor Surg 2007;83:1569-76
- Adjust antimicrobial prophylaxis dose for obese patients (body mass index >30)\*Anderson DJ, Kaye KS, Classen D, et al. Strategies to prevent surgical site infections in acute care hospitals. Infect Control Hosp Epidemiol 2008;29 (Suppl 1):S51-S61
- Use at least 50% fraction of inspired oxygen intraoperatively and immediately postoperatively in select procedure(s)\* Maragakis
   LL, Cosgrove SE, Martinez EA, et al. Intraoperative fraction of inspired oxygen is a modifiable risk factor for surgical site infection after spinal surgery. Anesthesiology 2009;110:556-562. and
   Meyhoff CS, Wetterslev J, Jorgensen LN, et al. Effect of high perioperative oxygen fraction on surgical site infection and pulmonary complications after abdominal surgery: The PROXI randomized clinical trial. JAMA 2009;302:1543-1550.

NOTE: These supplemental strategies are not part of the 1999 HICPAC Guideline for Prevention of Surgical Site Infections

# Prevention Strategies: Supplemental **Postoperative**

Feedback of surgeon specific infection rates.

### Measurement: Surgical Care Improvement Project (SCIP)

### **Process Measures**

<b>Quality Indicator</b>	Numerator	Denominator
Appropriate antibiotic choice	Number of patients who received the appropriate prophylactic antibiotic	All patients for whom prophylactic antibiotics are indicated
Appropriate timing of prophylactic antibiotics	Number of patients who received the prophylactic antibiotic within 1hr prior to incision (2hr: Vancomycin or Fluoroquinolones)	All patients for whom prophylactic antibiotics are indicated
Appropriate discontinuation of antibiotics	Number of patients who received prophylactic antibiotics and had them discontinued in 24 h (48h cardiac)	All patients who received prophylactic antibiotics

Fry DE. Surgical Site Infections and the Surgical Care Improvement Project (SCIP): Evolution of National Quality Measures. Surg Infect 2008;9(6):579-84.

### Measurement: Surgical Care Improvement Project (SCIP)

### **Process Measures (continued)**

<b>Quality Indicator</b>	Numerator	Denominator
Appropriate hair removal	Number of patients who did not have hair removed or who had hair removed with clippers	All surgical patients
Normothermia	Number of patients with postoperative temperature ≥36.0°C	All surgical patients
Glucose control	Number of cardiac surgery patients with glucose control at 6AM POD1 and POD2 (operation = POD0)	Patients undergoing cardiac surgery

Fry DE. Surgical Site Infections and the Surgical Care Improvement Project (SCIP): Evolution of National Quality Measures. Surg Infect 2008;9(6):579-84.

### <u># Patients with SSI after selected operations</u> X100 Total # of selected operations performed

- Crude, unadjusted rate
- Can lead to erroneous conclusions regarding SSI risk by institution and/or surgeon
- NOT for reporting or inter-hospital comparisons

### Measurement: Outcome Measures Risk Adjustment (1) NNIS Risk Index

### Score to predict risk of acquiring SSI

- Widely used-targeted at surveillance
- Operation-specific
- Allows monitoring of trends
- Facilitates comparison

#### - facility vs. national

Culver DH, Horan TC, Gaines RP. Surgical infection rates by wound class, operative procedure, patient risk index. Am J Med;1991:152S-157S.

### SAFER • HEALTHIER • PEOPLE<sup>™</sup>

### Measurement: Outcome Measures Risk Adjustment (2) NNIS Risk Index

- Focus on high volume operations
- Employs Risk Stratification
  - American Society of Anesthesiologists (ASA) score (3, 4, or 5)
  - Wound Classification (contaminated or dirty)
  - Duration of Procedure (over T [proc specific] hours)
- Does not include many patient & perioperative related SSI risk factors
- Increased NNIS Risk index = Increased risk of SSI

Culver DH, Horan TC, Gaines RP. Surgical infection rates by wound class, operative procedure, patient risk index. Am J Med;1991:152S-157S.

### Risk Adjustment (2)

### Standardized Incidence Ratio - SIR

Expected # SSI =

# operations\* in each proc risk category X NNIS rate

100

- Value >1.0 = more SSIs than expected
- Helps better identify outliers
- Will be used for comparison within NHSN in 2010

\*Performed by a surgeon, a surgical subspecialty service or a hospital Detailed explanation and examples in: Edwards JR, Horan TC. Risk-adjusted Comparisons. In: Carrico R, ed. APIC Text of Infection Control and Epidemiology, 3rd ed. Washington DC APIC 2009.Chapter 7, p.1-7.

### SAFER • HEALTHIER • PEOPLE™

### **Evaluation Considerations**

- Assess baseline policies and procedures
- Areas to consider
  - Surveillance
  - Prevention strategies
  - Measurement
- Coordinator should track new policies/practices implemented during collaboration
