**Active Bacterial Core Surveillance (ABCs) Report
 Emerging Infections Program Network
 Group B *Streptococcus*, 2020**

ABCs Areas: California (3 county San Francisco Bay area); Colorado (5 county Denver area); Connecticut; Georgia (20 county + State <1 year); Maryland; Minnesota; New Mexico; New York (15 county Rochester and Albany areas); Oregon (3 county Portland area); Tennessee (20 counties).

ABCs Population: The surveillance areas represent 38,060,771 persons and 463,619 live births. Source: National Center for Health Statistics bridged-race Vintage 2020 postcensal file and natality data from National Center for Health Statistics (NCHS)¹.

ABCs Case Definition: Invasive bacterial disease is defined as isolation of group B *Streptococcus* from a normally sterile site or detection of ABCs pathogen-specific nucleic acid in a specimen obtained from a normally sterile body site, using a validated molecular test in a resident of one of the surveillance areas. Early-onset cases occur at <7 days old and late-onset between 7 and 89 days old.

ABCs Methodology: ABCs personnel routinely contacted all microbiology laboratories serving acute care hospitals in their area to identify cases. Standardized case report forms that include information on demographic characteristics, clinical syndrome, and outcome of illness were completed for each identified case. From select surveillance areas, whole genome sequencing (WGS) was conducted for all group B *Streptococcus* isolates, which includes deduction of capsular serotype and minimum inhibitory concentration (MIC) predictions, including PBP2x typing to detect decreased beta lactam susceptibility. A strategic subset of isolates was targeted for conventional MIC determination. Regular laboratory audits assessed completeness of active surveillance and detected additional cases.

Rates of early-onset and late-onset group B streptococcal disease were calculated using live birth estimates for 2020. All other rates were calculated using population estimates from the bridged-race vintage postcensal file. For national estimates of cases, race- and age-specific rates of disease were applied from the aggregate surveillance area to the age and racial distribution of the U.S. population and to live birth estimates for early-onset and late-onset disease. Cases with missing data, excluding ethnicity, were multiply imputed using sequential regression imputation methods.[†]

ABCs Profiles

Race	No.	Rate*	Ethnicity	No.	Rate*	Cases		Deaths		
						Age (years)	No.	Rate*	No.	Rate*
Black	700	9.9	Hispanic	338	6.2	<1	257	53.7	20	4.18
White	2,488	9.2	Non-Hispanic	2,718	-	1	5	1.2	0	0.00
Other	218	5.8	Unknown	351	-	2-4	3	0.2	0	0.00
*Rates are per 100,000 population for ABCs areas						5-17	9	0.2	0	0.00
						18-34	153	1.7	12	0.14
						35-49	467	6.2	18	0.24
						50-64	993	13.5	61	0.83
						65-74	727	20.2	53	1.48
						75-84	510	29.3	47	2.70
						≥85	282	39.1	37	5.13
						Total	3,406	9.0	248	0.65
						**Rates are per 1,000 live births for ABCs areas				

National Estimates of Invasive Disease
 Early-Onset Cases: 740 (0.2/1,000 live births)
 Late-Onset Cases: 1,010 (0.28/1,000 live births)
 Total Cases: 29,540 (9.00/100,000 population)
 Deaths: 2,200 (0.67/100,000 population)

† Surveillance Note
 Missing race (n=347, including 19 cases <1 year old) data were multiply imputed using sequential regression imputation methods. For 2020, one surveillance site limited chart abstraction to infants only. N=145 adult cases from this site were excluded from multiple imputation.
