

ANTIBIOTIC RESISTANCE THE GLOBAL THREAT

Antibiotic resistance – when bacteria change and cause antibiotics to fail – is happening **RIGHT NOW**, across the world

The full impact is unknown. There is no system in place to track antibiotic resistance globally

Without urgent action, many modern medicines could become obsolete, turning even common infections into deadly threats.

A GROWING CRISIS WORLDWIDE

In the **EUROPEAN UNION**, antibiotic resistance causes 25,000 deaths per year and 2.5m extra hospital days¹

In **INDIA**, over 58,000 babies died in one year as a result of infection with resistant bacteria usually passed on from their mothers²

In **THAILAND**, antibiotic resistance causes 38,000+ deaths per year and 3.2m hospital days³

In the **UNITED STATES**, antibiotic resistance causes 23,000+ deaths per year and >2.0m illnesses⁴

CAUSES OF ANTIBIOTIC RESISTANCE

Over-prescribing of antibiotics

Patients not taking antibiotics as prescribed

Unnecessary antibiotics used in agriculture

Poor infection control in hospitals and clinics

Poor hygiene and sanitation practices

Lack of rapid laboratory tests

HOW CAN WE STOP IT?

1. Improve labs:

Countries need medical labs to identify bacteria and choose the right drugs to treat them.

2. Collect and share data:

Countries need systems to track cases and report results globally to make better policy decisions.

3. Use antibiotics wisely:

To ensure antibiotics are here when we need them, they must be prescribed and taken correctly now.

4. Take measures to prevent infections:

Especially in healthcare settings, good infection control practices are critical to stopping spread of resistant germs.
