Competencies for Applied Epidemiologists in Governmental Public Health Agencies:

Applied Epidemiology Competencies (AECs)

An introduction to the new standards of practice for epidemiologists working within the U.S. public health system.

AEC Development
In 2004, the Centers for Disease Control and Prevention (CDC) and the Council of State and Territorial Epidemiologists (CSTE) convened an expert panel\(^1\) to define the competencies of applied epidemiologists in governmental public health agencies.

The panel comprised leaders in epidemiology who work in local, state, and federal public health agencies and accomplished individuals from academia and industry.

Goal
To improve the practice of epidemiology in public health agencies.

Objectives
The panel set forth objectives to create a comprehensive list of competencies that

- Define the discipline of applied epidemiology and
- Describe what skills four different levels of practicing epidemiologists working in governmental public health agencies should have to accomplish required tasks.

\(^{1}\) The expert panel members are listed on the back of this brochure.
Competency Defined
Competencies are action-oriented statements that delineate the essential knowledge, skills, and abilities in the performance of work responsibilities. Competencies are describable and observable.

Epidemiology and Epidemiologist Defined
Epidemiology, one of the core sciences of public health, is “the study of the distribution and determinants of health-related states and events in specific populations, and the application of this study to control of health problems.”

An epidemiologist is a person who investigates the occurrence of disease, injury, or other health-related conditions or events in populations to describe the distribution of disease, or risk factors for disease, for population-based prevention and control.

Public health epidemiologists who work in local, state, and federal health agencies are critical for detecting, controlling, and preventing major health problems. Epidemiologists elucidate and communicate risks and recommend actions to prevent and control an array of serious threats to the public’s health.

The expert panel developed comprehensive epidemiology competencies spanning four levels of practitioners’ responsibility, experience, and skill. An extensive validation process allowed all levels of epidemiologists and stakeholders to provide quantitative and qualitative feedback. Thus, the competencies not only reflect an evidence-based approach to defining competence but also support those whose performance will be ascertained and ultimately improved.

Epidemiology Practitioners can use the competencies to assess their current skill level and define focus areas for additional training. Striving to achieve higher competency levels can be used as a career-development plan.

Employers can use the competencies to create career ladders for their epidemiology positions on an objective basis. Job descriptions can be aligned with the competencies to objectively evaluate a candidate’s merits in the field. Additionally, organizations can use the competencies to assess their overall epidemiologic capacity.

Educators can use the competencies to design education programs that meet public health agencies’ needs by mapping the competencies to epidemiology curricula. In addition, critical elements of epidemiology practice defined within the competencies can be incorporated into existing coursework. Consequently, epidemiology graduates will possess many of the skills outlined in the AECs, which will help them quickly transition into productive members of the public health workforce.

National Organizations can use the AECs to further develop the epidemiology workforce. For example, both the Epidemic Intelligence Service (EIS) and the CDC/CSTE Applied Epidemiology Fellowship curricula are being aligned to the AECs, and the Association of Schools of Public Health has developed guidelines for mapping the AECs to curricula.

AEC Resources
Full text of the competency document, additional background information about the AEC development process, and summaries of competencies by tier are available on the websites below. In addition, a “toolkit” is available with resources to help individuals and organizations incorporate the AECs into their practice.

For more information, visit
www.cdc.gov/AppliedEpiCompetencies
www.cste.org/competencies.asp

Lessons learned from implementation of the AECs will strengthen, and result in future revisions of, the competencies and toolkit.
