

## SAMPLE CLINIC TABLE

**A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 13–23.**

<sup>a</sup> Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT or a combination of these procedures with IVF.

<sup>b</sup> Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

<sup>c</sup> A multiple-infant birth is counted as one live birth if at least one infant is live born.

<sup>d</sup> When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

<sup>e</sup> Number excludes 0 oocyte/embryo banking cycle(s). (If 0, no banking cycles were reported.)

<sup>f</sup> All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.
