Appendix A

Technical Notes

APPENDIX A: TECHNICAL NOTES

Validation of 2012 ART Data

Site visits to assisted reproductive technology (ART) clinics for validation of 2012 ART data were conducted during April through June 2014. For validation of 2012 data, 35 of the 456 reporting clinics were randomly selected after taking into consideration the number of ART procedures performed at each clinic, some cycle and clinic characteristics, and whether the clinic had been selected before. During each validation visit, ART data reported by the clinic to the Centers for Disease Control and Prevention were compared with information documented in medical records.

For each clinic, the fully validated sample included up to 40 ART cycles resulting in pregnancy and up to 20 ART cycles not resulting in pregnancy. Up to 10 cycles using donor eggs were included among the fully validated sample at each clinic. In total, 2,045 ART cycles performed in 2012 across the 35 clinics were randomly selected for full validation, along with 238 egg/embryo banking cycles. The full validation included review of 1,318 cycles for which a pregnancy was reported. Among the nondonor cycles, 331 were multiple-fetus pregnancies. In addition, among patients whose cycles were validated, we verified the number of ART cycles performed during 2012. For each of these patients, we compared the total number of ART cycles reported with the total number of ART cycles included in the medical record. If unreported cycles were identified in selected medical records, up to 10 of these cycles were also selected for partial validation.

Findings and discrepancy rates from the 2012 validation visits will be available later this year.
