

Has the percentage of transfers that resulted in live births for all ART patients changed or only for those in particular age groups?

Figure 48 presents percentages of transfers using fresh nondonor eggs or embryos that resulted in live births, by the age of the woman.

From 2003 through 2012, the percentage of transfers that resulted in live births for women younger than age 35 increased from 43% in 2003 to 47% in 2012. During the same period, the percentage of transfers that resulted in live births increased slightly from 37% to 38% for women aged 35–37 years, from 26% to 28% for women aged 38–40, and from 15% to 16% for women aged 41–42.

Figure 48

Percentages of Transfers Using Fresh Nondonor Eggs or Embryos That Resulted in Live Births, by Age Group, 2003–2012

* 2006 was the last year in which data were reported together for women older than age 42.

† 2007 was the first year in which data for women older than age 42 were subdivided into ages 43–44 and >44.
