Asthma in Georgia

Asthma is a chronic lung disease that affects an estimated 16.4 million adults (aged ≥ 18 years) and 7.0 million children (aged < 18 years) in the United States (U.S.), regardless of age, sex, race, or ethnicity. Although the exact cause of asthma is unknown and it cannot be cured, it can be controlled with self-management education, appropriate medical care, and avoiding exposure to environmental triggers. The following data provide an overview of the burden of asthma in Georgia (GA) compared with the U.S.

All stated comparisons (e.g., higher, lower, similar) indicate that the group is statistically significantly different than the reference group (e.g., adults aged 18-24 years, men, non-Hispanic whites, children aged 15-17 years, and boys).

### Asthma Prevalence

In 2008, an estimated 603,748 adults in Georgia had asthma. Adult lifetime asthma prevalence was 12.7% and adult current asthma prevalence was 8.5% compared with U.S. rates of 13.3% and 8.5%, respectively.

Child current asthma prevalence was similar among all age groups when compared with children aged 15-17 years in Georgia; however, the rate was lower among children aged 0-4 years throughout the 38 participating states.

In 2008, an estimated 297,453 children in Georgia had asthma. Child lifetime asthma prevalence was 16.1% and child current asthma prevalence was 12.1% compared with the 38 participating states' rates of 13.3% and 9.0%, respectively.

Adult current asthma prevalence was similar among all age groups when compared with adults aged 18-24 years in Georgia; however, the rate was highest among adults aged 18-24 years throughout the U.S.

Child current asthma prevalence was similar among all age groups when compared with children aged 15-17 years in Georgia; however, the rate was lower among children aged 0-4 years throughout the 38 participating states.

Adult current asthma prevalence was higher among women than men in Georgia. A similar pattern occurred throughout the U.S.

Child current asthma prevalence was similar among boys and girls in Georgia; however, rates were higher among boys throughout the 38 participating states.

Adult current asthma prevalence was similar among all race/ethnic groups when compared with non-Hispanic whites in Georgia; however, rates were higher among non-Hispanic multirace persons and non-Hispanic blacks than non-Hispanic whites throughout the U.S.

Child current asthma prevalence was higher among non-Hispanic blacks than non-Hispanic whites in Georgia; however, rates were higher among non-Hispanic blacks and non-Hispanic multirace persons throughout the 38 participating states.

*The estimate is unstable.*
The age-adjusted asthma hospitalization rate in Georgia was 115.7/100,000 persons compared with the U.S. rate of 144/100,000 persons. In Georgia, the hospitalization rate for children was 121.1/100,000 persons and for adults was 110.8/100,000 persons.

Asthma was the underlying cause of death for 86 adults and less than 10** children in Georgia. The age-adjusted mortality rate in Georgia was 10.3/million and the U.S. rate was 11.0/million. **The estimate is suppressed.

### Patient Education: Adults with Current Asthma

<table>
<thead>
