

Colorectal Cancer (CRC) Screening in Guam

Behavioral Risk Factor Surveillance System—2016

CRC screening test use* in Guam has increased since 2012.

In 2016, 44.2% of age-eligible residents had a current CRC screening test. Although overall screening test use increased, it remained significantly below the U.S. national average. Screening occurred more frequently in men, people who were insured, and people aged 65 to 75 years.

CRC screening test use, by race/ethnicity:

CRC screening test use, by insurance status:

CRC screening test use, by sex:

CRC screening test use, by age:

*Proportion of people who reported completing a screening test for CRC among all people who could be screened based on age (50 – 75 years). People who were current with CRC screening in 2016 either received a home-based blood stool test within the past year; a colonoscopy within the past 10 years; or sigmoidoscopy within the past 5 years combined with a blood stool test within in the past 3 years (2008 US Preventive Services Task Force Recommendations).

Footnotes:

Prevalence of screening test use account for the differences in age among states; estimates based on small numbers not shown. The U.S. CRC screening test use prevalence estimate excludes Puerto Rico and Guam.

Self-reported screening test use comes from CDC's Behavioral Risk Factor Surveillance System, 2016.

Population estimates for states and D.C. are from CDC's National Center for Health Statistics (released 6/26/2017).
