

In the United States in 2018—

**218,520** new lung cancers were reported

**142,080** people died from lung cancer

Men had higher rates\* of getting and dying from lung cancer than women.

\*Age-adjusted rate per 100,000 standard population

**5-Year  
Relative Survival**

23% of lung cancer patients who were diagnosed between 2011 and 2017 had not died from their cancer 5 years later.

Most lung cancers are found after the cancer has spread to other parts of the body, when survival is lowest. Lung cancer screening can find cancer earlier, when treatment works better.

Among people diagnosed with lung cancer between 2013 and 2017, about 394,800 were still alive on January 1, 2018.
