There are five main types of cancer that affect a woman's reproductive organs: cervical, ovarian, uterine, vaginal, and vulvar. As a group, they are referred to as gynecologic (GY-neh-kuh-LAH-jik) cancer. (A sixth type of gynecologic cancer is the very rare fallopian tube cancer.)

This fact sheet about vaginal & vulvar cancers is part of the Centers for Disease Control and Prevention's (CDC) Inside Knowledge: About Gynecologic Cancer campaign. The campaign helps women get the facts about gynecologic cancer, providing important “inside knowledge” about their bodies and health.

What are vaginal and vulvar cancers?

Cancer is a disease in which cells in the body grow out of control. Cancer is always named for the part of the body where it starts, even if it spreads to other body parts later.

When cancer starts in the vagina, it is called vaginal cancer. The vagina, also called the birth canal, is the hollow, tube-like channel between the bottom of the uterus and the outside of the body.

When cancer forms in the vulva, it is vulvar cancer. The vulva is the outer part of the female genital organs. It has two folds of skin, called the labia. Vulvar cancer most often occurs on the inner edges of the labia.

When vaginal and vulvar cancers are found early, treatment is most effective.

Are there tests that can find vaginal and vulvar cancers early?

The best ways to find vaginal and vulvar cancers early are to get regular checkups and to see a doctor if you have any signs or symptoms, such as lumps or changes in the vagina or vulva. The doctor may perform tests or other procedures to find out what is causing these symptoms.

Your doctor also may recommend more follow-up tests or more frequent exams to check for vaginal or vulvar cancers if you have had abnormal Pap test results or a history of cervical cancer. These things may place you at a higher risk of getting HPV-associated cancers, like vaginal, vulvar, and cervical cancers. It is important to note that the Pap test does not screen for vaginal and vulvar cancers. The only cancer the Pap test screens for is cervical cancer.
Can the HPV vaccine prevent vaginal and vulvar cancers?
Many vaginal and vulvar cancers are caused by the human papillomavirus (HPV), a common virus that is passed from one person to another during sex.
There is a vaccine that protects against the types of HPV that most often cause cervical, vaginal, and vulvar cancers. It is recommended for preteens (both boys and girls) aged 11 to 12 years, but can be given as early as age 9 and until age 26. The vaccine is given in a series of either two or three shots, depending on age. If you or someone you care about is in this age range, talk with a doctor or other health professional about it.

To learn more about the HPV vaccine visit www.cdc.gov/hpv/index.html.

What raises a woman’s chance of getting vaginal or vulvar cancer?
There is no way to know for sure if you will get vaginal or vulvar cancer. Some women get these cancers without being at high risk. However, the following factors may increase a woman’s risk for vaginal or vulvar cancer:
- Having HPV.
- Having had cervical precancer or cervical cancer.
- Having a condition (such as HIV, the virus that can lead to AIDS) that makes it hard for your body to fight off health problems.
- Smoking.
- Having ongoing vulvar itching or burning.

What should I do if my doctor says I have vaginal or vulvar cancer?
If your doctor says that you have vaginal or vulvar cancer, ask to be referred to a gynecologic oncologist—a doctor who has been trained to treat cancers like these. This doctor will work with you to create a treatment plan.

Where can I find more information about vaginal, vulvar, and other gynecologic cancers?
Centers for Disease Control and Prevention: 800-CDC-INFO or www.cdc.gov/cancer/gynecologic
National Cancer Institute: 800-4-CANCER or www.cancer.gov
