Each year in the United States, more than 1.6 million people are diagnosed with cancer, and nearly 600,000 die from it, making it the second leading cause of death. The cost of cancer care continues to rise and is expected to reach almost $174 billion by 2020. CDC is a leader in efforts to reduce preventable cancers and improve the health of cancer survivors. Several divisions within CDC’s National Center for Chronic Disease Prevention and Health Promotion work to reduce risk factors for preventable cancers, promote screening to catch cancer early, and collect data on all notifiable cancer cases in the United States.

**Preventable Risk Factors and CDC’s Response**

**Risk Factor**

**Smoking and Secondhand Smoke Exposure**

Smoking and secondhand smoke cause about 90% of lung cancer deaths in the United States. Smoking also causes cancer of the voice box (larynx), mouth and throat, esophagus, urinary bladder, kidney, pancreas, cervix, colon, rectum, liver, and stomach, as well as a type of blood cancer called acute myeloid leukemia. About 34 million US adults smoke cigarettes, and every day, about 2,000 young people under age 18 smoke their first cigarette.

Nonsmokers who are exposed to secondhand smoke at home or at work have a 20% to 30% higher risk of lung cancer. Secondhand smoke causes more than 7,300 lung cancer deaths among US nonsmokers each year. In the United States, 58 million nonsmokers are exposed to secondhand smoke every year.

**CDC’s Response**

CDC’s Office on Smoking and Health is at the forefront of the nation’s efforts to reduce deaths and prevent chronic diseases, including cancer, that result from smoking. CDC and its partners promote efforts to prevent young people from starting to smoke, create smokefree worksites and
public spaces, help smokers quit, and reduce health disparities for groups with higher rates of chronic diseases caused by smoking.

CDC’s Tips From Former Smokers® (Tips®) campaign, the first federally funded tobacco education campaign, focuses on motivating US adults who smoke to try to quit. Tips features real people—not actors—who are living with serious health conditions caused by smoking and secondhand smoke exposure. It connects people who smoke with resources to help them quit, including 1-800-QUIT-NOW, which directs people to free services from their state quitlines.

---

**Exposure to Sun and Tanning Beds**

Skin cancer is the most common cancer in the United States. Most cases of melanoma, the deadliest kind of [skin cancer](#), are caused by exposure to ultraviolet (UV) light from the sun or tanning beds. Although use of sun protection has increased slightly in recent years, sunburn is common in the United States, with about one-third of adults and over half of high school students getting sunburned each year.

**CDC’S RESPONSE**

CDC’s [Division of Cancer Prevention and Control](#) (DCPC) provides leadership for national efforts to reduce illness and death caused by skin cancer. Each year, CDC publishes the [Skin Cancer Prevention Progress Report](#) as a follow up to [The Surgeon General's Call to Action to Prevent Skin Cancer](#) released in 2014. These reports highlight recent prevention efforts, new data, and success stories. CDC also conducts surveillance and research to provide data on rates of new melanoma cases, sunscreen use, and indoor tanning behaviors.

---

**Overweight and Obesity**

Overweight and obesity are associated with at least 13 types of cancer, including endometrial (uterine) cancer, breast cancer in postmenopausal women, and colorectal cancer. These forms of cancer make up 40% of all cancers diagnosed. In the United States, 40% of adults have obesity, and 72% are overweight or have obesity.

**CDC’S RESPONSE**

CDC’s [Division of Nutrition, Physical Activity, and Obesity](#) develops and shares evidence-based approaches that help make healthy living easier for everyone, which can help people reduce their risk of cancer. To promote good nutrition, the division works with hospitals to support breastfeeding moms, child care centers to adopt healthy eating standards, and workplaces to change policies so that employees have
more healthy food choices. To increase physical activity opportunities, the division partners with state and local governments to promote improvements in community design, such as sidewalks and parks, that make physical activity safer and more convenient for people of all ages and abilities.

**RISK FACTOR**

**Excessive Alcohol Use**

Excessive alcohol use, either in the form of binge drinking (5 or more drinks on an occasion for men or 4 or more drinks on an occasion for women) or heavy drinking (15 or more drinks per week for men or 8 or more drinks per week for women), increases the risk of cancer of the breast (in women), liver, colon, rectum, mouth, pharynx, larynx, and esophagus. About 17% of US adults report binge drinking, and 6% report heavy drinking.

**CDC'S RESPONSE**

CDC's Alcohol Program works to strengthen the scientific foundation for preventing excessive alcohol use, which is a risk factor for cancer. The program developed the Alcohol-Related Disease Impact (ARDI) application, which allows users to estimate deaths and years of potential life lost from excessive alcohol use. The program also funds and guides scientists in some states to study excessive drinking so that state leaders have the information they need to change policies and environments to prevent this key health risk.

**RISK FACTOR**

**Infectious Diseases**

Human papillomavirus (HPV) causes most cervical cancers, as well as some cancers of the vagina, vulva, penis, anus, rectum, and oropharynx (cancers of the back of the throat, including the base of the tongue and tonsils). The HPV vaccine helps prevent most of these cancers and is most effective when given in two doses, about 6 to 12 months apart, starting at age 11 or 12. Nationwide, 60% of boys and girls have received at least one dose of the HPV vaccine. That means many preteen boys and girls have not been vaccinated against HPV, leaving them vulnerable to cancers caused by HPV infections.

Many liver cancer cases are related to the hepatitis B or hepatitis C viruses. The hepatitis B vaccine can help lower liver cancer risk and is recommended for all infants and unvaccinated children and some groups of unvaccinated adults. There is no vaccine for hepatitis C, but many people can benefit from treatment options that can eliminate the virus from the body and prevent further liver damage. Many Americans with hepatitis C are not aware of it. CDC recommends that anyone who was born from 1945 to 1965 get tested for hepatitis C.
CDC'S RESPONSE

DCPC leads efforts to use cancer registry data to estimate how many HPV-associated cancers occur in the United States. The National Breast and Cervical Cancer Early Detection Program helps reduce deaths from cervical cancer by expanding access to cancer screening services. The Inside Knowledge About Gynecologic Cancer campaign raises awareness among women and health care providers about the five main types of gynecologic cancers: cervical, ovarian, uterine, vaginal, and vulvar. DCPC also collaborates with CDC's Division of Viral Hepatitis on liver cancer prevention activities that align with national recommendations.

Screening to Prevent or Catch Cancer Early

Getting recommended screening tests can help prevent colorectal and cervical cancers. Screening for adults at normal risk can also find breast, cervical, and colon cancers early, when treatment works best. However, screening rates for these cancers remain below national targets set by Healthy People 2020, the nation's agenda for improving the health of all Americans.

DCPC runs the Colorectal Cancer Control Program, which funds 23 states, 6 universities, and 1 American Indian tribe to increase colorectal cancer screening among men and women aged 50 or older. CDC's National Breast and Cervical Cancer Early Detection Program funds programs in all 50 states and the District of Columbia to provide access to breast and cervical cancer screening for low-income women with little or no health insurance.

CDC also uses media campaigns to educate people about the importance of cancer screenings. For example, the Bring Your Brave campaign is designed to inspire women under age 45 to learn their risk of breast cancer and talk with their doctor about how to reduce it. The Inside Knowledge campaign raises awareness about gynecologic cancers. The Screen for Life: National Colorectal Cancer Action Campaign raises awareness about colorectal cancer screening.

Data Collection Key to CDC’s Efforts

To help Americans prevent cancer—or catch it early when possible—we need to know what cancers are being diagnosed, in what groups, and where. CDC's National Program of Cancer Registries collects data for all notifiable cancer cases in the United States. The National Comprehensive Cancer Control Program funds states, territories, and tribes to use CDC surveillance data to learn more about the cancers and risk factors that affect their communities, create and follow plans to reduce cancer risk and improve cancer outcomes, and reduce disparities in rates of cancer and access to cancer care.
