Cardiovascular disease refers to several types of conditions that affect the heart and blood vessels. Cardiovascular diseases, including heart disease and stroke, account for one-third of all U.S. deaths and contribute an estimated $315 billion annually in healthcare costs and lost productivity.¹ ² Many cardiovascular disease risk factors, such as high blood pressure, high cholesterol, excess weight, poor diet, smoking and diabetes, can be prevented or treated through behavior change and appropriate medication.³

This brochure is designed to help public health program planners, community advocates, educators, primary care providers and policymakers find proven intervention strategies—including programs, services and policies—to plan evidence-based care that has been proven to reduce patients’ risk for cardiovascular disease. It can help decision makers in both public and private sectors make choices about what intervention strategies are best for their communities. This brochure summarizes information in The Guide to Community Preventive Services (The Community Guide), an essential resource for people who want to know what works in public health.

Use the information in this brochure to help select from the following intervention strategies you can use in your community and healthcare organizations:

- Introduce clinical decision-support systems within healthcare systems to implement clinical guidelines at the point of care.
- Reduce out-of-pocket costs for medications to control high blood pressure and high cholesterol in patients.
- Incorporate multidisciplinary team-based care within healthcare systems, including the patient, the primary care provider, and other professionals such as nurses, pharmacists, dietitians, social workers and community health workers, in order to improve blood pressure control.

The Community Guide provides evidence-based findings and recommendations from the Community Preventive Services Task Force (Task Force) about community preventive services, programs, and policies to improve health. Learn more about The Community Guide and what works to prevent cardiovascular disease by visiting www.thecommunityguide.org/cvd/index.
THE PUBLIC HEALTH CHALLENGE

Cardiovascular disease is the leading cause of death globally.4

- Nearly 800,000 people die in the U.S. each year from cardiovascular diseases—that’s almost 1 out of every 3 deaths.5
- Approximately every 1 minute and 23 seconds, an American will die from a coronary event.2
- Almost half of Americans exhibit at least one of three key cardiovascular disease risk factors including hypertension, uncontrolled high levels of low-density lipoprotein cholesterol and smoking.6
- Smoking, physical inactivity, and poor diet increase the risk of cardiovascular disease.7

For more about cardiovascular disease prevention and control, visit www.cdc.gov/dhdsp/index.htm.

EVALUATING THE EVIDENCE

- The Task Force findings and recommendations for interventions that prevent cardiovascular disease are based on systematic reviews of the available evidence.
- The systematic reviews look at the results of research and evaluation studies published in peer-reviewed journals and other sources.
- Each systematic review looks at the intervention strategy’s effectiveness and how it works in different populations and settings. If found effective, cost and return on investment are also reviewed when available.
- For each intervention strategy, a summary of the systematic review, evidence gaps, and journal publications can be found on the Cardiovascular Disease section of the website at www.thecommunityguide.org/cvd/index.

High blood pressure is a leading cause of heart disease and stroke in the U.S.

The Guide to Community Preventive Services (The Community Guide) is an essential resource for people who want to know what works in public health. It provides evidence-based recommendations and findings about public health interventions and policies to improve health and promote safety. The Community Preventive Services Task Force (Task Force)—an independent, nonfederal, unpaid body of public health and prevention experts—bases its findings and recommendations on systematic reviews of the scientific literature. With oversight from the Task Force, scientists and subject matter experts from the Centers for Disease Control and Prevention conduct these reviews in collaboration with a wide range of government, academic, policy, and practice-based partners.

More information about how the Task Force conducts its reviews is available at www.thecommunityguide.org/about/methods.html.
SUMMARIZING THE FINDINGS ON CARDIOVASCULAR DISEASE

All Task Force findings and recommendations on preventing cardiovascular disease are available online at www.thecommunityguide.org/cvd/index. Some of the Task Force recommendations related to preventing cardiovascular disease are below.

✓ Implementing Clinical Decision-Support Systems at the point-of-care. Provider practices related to screening for cardiovascular disease risk factors and for cardiovascular disease-related preventive care services, clinical tests and treatments can be improved through the use of clinical decision-support systems. These computer-based information systems are designed to assist healthcare providers by providing patient-specific information during healthcare visits. Clinical decision-support systems allow healthcare providers to screen for cardiovascular disease risk factors, assess a patient’s risk for developing cardiovascular disease, and alert patients during visits when health indicators for cardiovascular disease risk factors are elevated.

✓ Reducing out of pocket costs for patients. Reducing out-of-pocket costs for medications to control high blood pressure and high cholesterol can be implemented alone or in combination with other interventions including team-based care. In addition, reducing out-of-pocket costs can increase medication adherence, which subsequently helps increase the proportion of patients that meet the recommended blood pressure goal by a median of 18 percentage points, as well as a median increase of 13 percentage points for the proportion of patients who meet the recommended cholesterol goal.

✓ Incorporating team-based care in health systems. Team-based care consists of a healthcare team that works together to improve patient care. The coordinated team includes the patient, the patient’s primary care provider, as well as other health professionals (e.g., nurses, pharmacists and dietitians). Team-based care interventions allow for communication between team members, the use of clinical guidelines by team members, consistent monitoring of patient progress, and engagement of patients in their own care. This can reduce cardiovascular disease risk by improving blood pressure control. Healthcare systems that used team-based care increased the proportion of patients with controlled blood pressure by a median of 12 percentage points when compared to usual care.

PUTTING THE TASK FORCE FINDINGS TO WORK

As a public health decision maker, practitioner, community leader, or someone who can influence the health of your community, you can use The Community Guide to create a blueprint for success.

Kaiser Permanente Colorado Implements Hypertension Management Program

With more than 85,000 adult patients diagnosed with high blood pressure in the Denver metropolitan area alone, Kaiser Permanente Colorado implemented several evidence-based strategies aimed at increasing the hypertension control rate within its patient population. The Hypertension Management Program emphasizes a team-based, integrated approach to care for patients with high blood pressure, utilizing some of the strategies recommended in The Community Guide. This includes creating registries that care teams can use to help individuals proactively manage their blood pressure and other chronic diseases. As a result of these changes, hypertension control rates rose from just over 61 percent in January 2008 to nearly 83 percent by fall 2012.

West End Medical Centers Implements Patient-Centered Medical Home Model

West End Medical Centers, Inc. (WEMC) provides comprehensive primary healthcare services in seven locations throughout Georgia’s Fulton and Cobb counties. WEMC is a patient-centered medical home and a nonprofit organization of federally qualified health centers. WEMC’s patient population is predominantly African American, female and nearly half are uninsured. WEMC’s care model utilizes many of the strategies recommended by The Community Guide, including a focus on physician-led provider teams who work with patients to develop and manage their hypertension. Patients with uncontrolled blood pressure receive referrals for additional care and support services, including medications, access to a dietician, and fitness instruction as part of a health education program. As a result of these changes, 63 percent of WEMC’s 4,000 hypertensive patients had controlled blood pressure by 2012.

REFERENCES

The Community Preventive Services Task Force (Task Force) has released the following findings on what works in public health to prevent cardiovascular disease. These findings are compiled in The Guide to Community Preventive Services (The Community Guide) and listed in the table below. Use the findings to identify strategies and interventions you could use for your community.

Legend for Task Force Findings:  
- **Recommended**
- **Insufficient Evidence**
- **Recommended Against**  
(See reverse for detailed descriptions.)

The Centers for Disease Control and Prevention provides administrative, research, and technical support for the Community Preventive Services Task Force.
UNDERSTANDING THE FINDINGS

The Task Force bases its findings and recommendations on systematic reviews of the scientific literature. With oversight from the Task Force, scientists and subject matter experts from the Centers for Disease Control and Prevention conduct these reviews in collaboration with a wide range of government, academic, policy, and practice-based partners. Based on the strength of the evidence, the Task Force assigns each intervention to one of the categories below.

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>DESCRIPTION</th>
<th>ICON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recommended</td>
<td>There is strong or sufficient evidence that the intervention is <strong>effective</strong>. This finding is based on the number of studies, how well the studies were designed and carried out, and the consistency and strength of the results.</td>
<td><img src="https://www.thecommunityguide.org/about/methods.html" alt="Green Circle" /></td>
</tr>
<tr>
<td>Insufficient Evidence</td>
<td>There is <strong>not enough evidence</strong> to determine whether the intervention is effective. This does not mean the intervention does not work. There is not enough research available or the results are too inconsistent to make a firm conclusion about the intervention’s effectiveness. The Task Force encourages those who use interventions with insufficient evidence to evaluate their efforts.</td>
<td><img src="https://www.thecommunityguide.org/about/methods.html" alt="Yellow Diamond" /></td>
</tr>
<tr>
<td>Recommended Against</td>
<td>There is strong or sufficient evidence that the strategy is <strong>harmful or not effective</strong>.</td>
<td><img src="https://www.thecommunityguide.org/about/methods.html" alt="Red Triangle" /></td>
</tr>
</tbody>
</table>

Visit the “Systematic Review Methods” page on The Community Guide website at [www.thecommunityguide.org/about/methods.html](http://www.thecommunityguide.org/about/methods.html) for more information about the methods used to conduct the systematic reviews and the criteria the Task Force uses to make findings and recommendations.
