

Report/Export

- Title
 - Video Tutorial for the Interactive Atlas of Heart Disease and Stroke
 - How to generate reports using the Report/Export tool
 - <https://nccd.cdc.gov/DHDSPAtlas/>
- Transcript
 - The Report or Export tool allows the user to create and export reports to view data for a specific county, state, or selection of counties or states. You can generate a report by moving the cursor to the top navigation panel and selecting the Report/Export tool. A new dialog box will appear. Move the cursor to the dialog. There are two options. You can 'Select Data by Location' which entails using a map to highlight the group of counties of interest. Or you can 'Select Data by Search', which entails identifying the county of interest from a dropdown list.
 -
 - To 'Select Data by Location' move the cursor to the boundary selection tools. Available tools are polygon, rectangle, circle, and point. Select a tool and pick your 'Select Method' from the drop down. Draw on the map to select a group of counties. Counties may also be removed from the selected set with the subtract point tool.
 -
 - To 'Select Data by Search', type a county name in the 'Search' box and click 'select'. After the county name is selected, move the cursor to the bottom right of the dialog and click the 'Next' button.
 - After you have selected a county or group of counties, you can add any additional risk factor, social and economic or health services data for that county and then click 'Next'. You now have two options. You can select "Generate Report" to create a printable report for each of your selected counties, OR you can select "Export Data" to save the data as a spreadsheet. This concludes the video tutorial for generating reports using the Report or Export tool.
