Sustainability

Sustainability can be defined as a country's ongoing maintenance and support of a routine virologic and epidemiologic influenza surveillance system including the capacity to financially maintain the system or a portion of the system.

When countries transition from the capacity-building phase to the sustainability phase, they are asked to develop and implement a plan for influenza surveillance initiated or enhanced during the capacity-building phase. The plan should be reviewed annually or as changes occur.

Developing such a sustainability plan is a critical part of the transition to a sustainable system. A written plan can provide overarching guidance for your initiative. A plan can help an organization:

- Sustain systems using government funds.
- Obtain input and agreement from key stakeholders (i.e. MOH, WHO, etc.).
- Make the best use of human capital, funding and other resources to achieve your objectives.
- Develop strategies for long-term success.

### CDC International Influenza Program Sustainability Framework and Element Descriptions

| PC | Internal resources and support needed to effectively manage your program |
| F | Establishing a financial base for your program |
| SP | Systematic process that guides your program’s direction, goals, and strategies |
| C | Conveying information to stakeholders and the public about your program |
| P | Establish and foster connections between your program and its stakeholders |
| PE | Analyzing your program for effectiveness and efficiency |

Sustainability Framework and Element Descriptions for CDC’s International Influenza Program.
To assist grantees with their plans, CDC’s Influenza Division developed the International Influenza Program Sustainability Guide and Framework (Guide). The Guide consists of six elements: Program Capacity, Strategic Planning, Partnerships, Funding, Communications, and Program Evaluation. These elements provide the framework for sustainability planning and implementation.

Some expectations of sustainability include:

- Establishing country ownership and investing in country-led plans (Global Health Initiative).
- Aligning goals with national priorities.
- Developing and implementing sustainability plans with a detailed budget to fully assume responsibilities and funding for robust and timely routine surveillance systems for seasonal, novel and pandemic influenza.
- Ensuring systems have the ability for rapid detection of and response to potential pandemic influenza as well as for monitoring the occurrence and assessing the impact of seasonal influenza in the country.
- Maintaining or making progress towards having an active World Health Organization (WHO) National Influenza Center (NIC) laboratory and contributing regularly to the Global Influenza Surveillance and Response System (GISRS).

Sustainability should be discussed continuously and plans updated as things change so countries can develop surveillance networks that will continue after U.S. government funding ends and provide the necessary data to accurately identify and track potential public health issues.
