ACTIVITY
THE OPERATION OUTBREAK TEAM

ACTIVITY DETAILS
AGE or GRADE LEVEL
Middle and High School

LEARNING OBJECTIVES
• Identify steps during an influenza outbreak investigation.
• Identify roles and responsibilities of public health and animal health professionals in an influenza outbreak investigation and the skills each needs to fulfill their roles.

PROBLEM-BASED SKILL(S)
Collaborative performance

NATIONAL STANDARDS
HS-EPHS1-2: Discuss how epidemiologic thinking and a public health approach is used to transform a narrative into an evidence-based explanation.
https://www.cdc.gov/careerpaths/k12teacherroadmap/pdfs/ephs-competencies.pdf

NGSS Science & Engineering Practice(s):
Obtaining, evaluating, and communicating information; Crosscutting Concept(s): Cause and effect
http://www.nextgenscience.org/get-to-know

ACTIVITY TIME
45 minutes

HANDOUTS
• Role Play Cards

MATERIALS
The Junior Disease Detectives, Operation: Outbreak graphic novel
(www.cdc.gov/flu/graphicnovel)
Scissors, tape

INTRODUCTION
The outbreak investigation portion of the story begins after the Thomas County Fair. At the fair, Eddie shows his pig named Hamlet, and he notices that Hamlet appears sluggish.

Later, Eddie becomes very sick with flu-like symptoms, including a fever of 101 degrees, a cough, and muscle aches. His mother takes him to visit his primary care physician, Dr. Walker. Dr. Walker collects clinical information and a respiratory specimen (a nasal swab) from Eddie, which she sends to a local clinical laboratory for testing. Laboratory testing is used by physicians to identify the cause of a patient’s illness. Clinical specimens from patients are also used as part of routine monitoring, or surveillance, of an illness.

Both the clinical laboratory and, subsequently, the state public health laboratory are unable to identify the source of Eddie’s illness. Therefore, per federal and international health regulations reporting protocols, the state public health laboratory scientist reports Eddie’s case to the Centers for Disease Control and Prevention (CDC), a federal public health agency, and sends the specimen there for additional testing.

The state epidemiologist and his staff are particularly concerned with Eddie’s illness because testing at the state public health laboratory is unable to identify the pathogen responsible. This suggests the cause of Eddie’s illness could be something new or uncommonly associated with human infections.

As the story continues, the state epidemiologist, Jim Jefferies, then contacts a CDC epidemiologist, Dr. Lee, and explains the situation. Because the state public health laboratory was unable to identify the cause, Jim Jefferies and Dr. Lee decide to work together
Public and animal health authorities investigate novel influenza virus infections among people to determine if these viruses are changing in ways that would allow them to spread more easily among people and potentially cause a pandemic.

During the course of an outbreak investigation, there is a need for many professionals to consult with one another. Depending on the size and scale of an outbreak investigation, the number of public and animal health professionals involved may vary and their roles can expand and change. Overall, the collaboration of professionals with expertise in the areas of epidemiology, laboratory testing, animal health, communications, policy, statistics, and clinical care is what makes the investigation possible.

As part of the investigation, CDC experts, including informaticians, data managers, biostatisticians and laboratory scientists work behind the scenes. The data managers set up databases to store information that EIS officers and other epidemiologists collect in a manner that will allow for efficient data analyses with the support of biostatisticians. Public health laboratory scientists work to characterize the virus that infected Eddie, while staff at USDA's laboratories analyze specimens collected by the state veterinarian from some of the animals present at the Thomas County Fair. The virus specimen testing results from both CDC and USDA’s laboratories are compared to determine if there are similarities between the viruses collected from people and animals.

Throughout the investigation, health communications specialists formulate a strategy based on well-established risk communications principles. They help to create communication products based on data and guidance from other public health officials to educate the public, media and other audiences about what is known and not known about the outbreak, and what actions people should take to protect themselves and their families. Health communications specialists help coordinate communications efforts and messages between local, state and federal partners, and then
communicate necessary information to external audiences.

DID YOU KNOW
Influenza viruses circulate among pigs and other animals, like birds and dogs that are different from the viruses that circulate in people. Experts believe all four influenza pandemics that occurred in the last 100 years were caused by viruses that originated from birds or pigs, and later gained the ability to spread among people.

ACTIVITY INSTRUCTIONS
EXPLAIN
Different public health professionals play key roles in outbreak investigations based on their areas of expertise. By leveraging their diverse skill sets, they enhance collaboration and carry out the investigation efficiently.

Establishing data collection, management and reporting protocols as well as communication procedures allow different public and animal health professionals at the local, state and federal levels to work together to identify the cause of Eddie’s illness and establish measures to ensure additional people do not get sick.

In this activity, students will learn about the roles of different characters from the graphic novel. Then, together, they will decide the action sequence of the outbreak investigation using the graphic novel as a guide.

DIRECTIONS
1. Print enough sets of the role play cards so that each student in the class has at least one role. There are 14 roles in a set. Mark each set with a letter: A, B, C, etc.

2. Hand out the role play cards, and then have students find other students with the same role play card. Have each team consider the following:
   - What general responsibilities does this person have in their job?
   - What professional skills might this person need to do their job?
   - What role might this person have during an influenza outbreak investigation?
   - Who might this person communicate with during an influenza outbreak investigation?

3. Group students based on their role play card set marked with a letter A, B, C, etc. Within each group, have each student present 3-4 key facts about their role to the group.

4. Have each group work together to determine the steps of the influenza outbreak investigation by ordering their set of role play cards according to when each role would become involved in the outbreak investigation.

5. When each group comes to a consensus on the order of the steps of the influenza outbreak investigation, have each group tape their role play cards on a wall, accordingly.

6. Then, instruct each group to add arrows that show communication pathways among the roles.

7. Assign students to write up a 1 or 2 page story about how the outbreak was investigated based on the steps of the influenza outbreak investigation and the communication pathways.
DISCUSS

- Why would one case of respiratory illness caused by an unidentified virus in a person who recently attended an agricultural fair be cause for concern?
- Why is it beneficial to have public health and animal health professionals with different roles, skills, and disciplines involved in an influenza outbreak investigation?

INFORMATION

Activities were developed as a collaboration between the CDC Science Ambassador Fellowship; ten Science, Technology, Engineering, and Mathematics (STEM) teachers from across the country who participated in the 2017 CDC Science Ambassador Fellowship; and CDC’s Influenza Division.

CDC’s Division of Scientific Education and Professional Development

The following experts in education from the U.S. Centers for Disease Control and Prevention provided leadership, content development, and editing for these activities: Kelly Cordeira, MPH, Student Programs and Partnerships Lead, Division of Scientific Education and Professional Development, Center for Surveillance, Epidemiology, and Laboratory Services.

CDC Science Ambassador Fellows

The following STEM teachers who participated in the 2017 CDC Science Ambassador Fellowship within CDC’s Division of Scientific Education and Professional Development co-developed the educational activities in consultation with CDC experts: Richard Blauvelt, MPH, MAT (Harper Woods, Michigan); Tami Caraballo, MEd (Snohomish, Washington); Karen Krieger, MSSE, PhD (Phnom Penh, Cambodia); Sarah Sletten, PhD (Fargo, North Dakota); Tina Gibson, MS EdD, 2017 Peer Leader (Columbus, Indiana); Clara Bennion, MSED (Camdenton, Missouri); Pam Gilmore, MS (Muskego, Wisconsin); Larisa Masson (Portland, Oregon); Susannah Miller, MA (Indianapolis, Indiana); Valencia LaPrelle’ Williams, PhD, 2017 Peer Leader (Ontario, California).

CDC’s Influenza Division

The following experts from the U.S. Centers for Disease Control and Prevention provided consultation: Douglas Jordan, MA, Influenza Division, National Center for Immunization and Respiratory Diseases; Lt. Col. (R) Joe Gregg, Influenza Coordination Unit, National Center for Immunization and Respiratory Diseases; Alicia Budd, MPH, Influenza Division, National Center for Immunization and Respiratory Diseases; James Kile, DVM, MPH, Influenza Division, National Center for Immunization and Respiratory Diseases; Michael Jhung, MD, MPH, Division of Foodborne, Waterborne, and Environmental Diseases, National Center for Emerging and Zoonotic Infectious Diseases.

**State public health veterinarian**

A veterinarian who works for the state health department, focusing their efforts on protecting human populations from infections caused by zoonotic diseases and from injuries caused by animals

Knowledge of clinical animal medicine and general public health knowledge, willingness to work in different environments and ability to work collaboratively with other animal and public health specialists at the federal, state, and local level

Coordinate public health activities, collect human epidemiologic information; coordinate with animal health authorities and activities

State animal health official; state public health epidemiologist, CDC representatives, including epidemiologists, laboratory staff, and communications specialists

**Thomas County fair director**

A person who coordinates fair activities and communicates with all stakeholders

Knowledge and oversight of local, state, and federal requirements and recommendations from public health officials at the fair; and ability to communicate clearly

Support communication between the state health department and state fair attendees

Animal health official or veterinarian, state epidemiologist; state public health veterinarian, fair attendees

**State veterinarian**

A veterinarian who works for the state agriculture department, focusing their efforts on protecting livestock and other animal populations from zoonotic and animal diseases

Knowledge of clinical animal medicine, ability to think critically and problem solve, ability to communicate clearly, willingness to work in various environments and ability to work collaboratively with other specialists, including federal, state, and local animal and public health partners

Coordinate animal health activities within their jurisdiction, authorize testing of swine samples, direct sample collection of animals, make decisions regarding animal health and coordinate with public health activities

State public health veterinarian; State Epidemiologist; State agricultural authorities; fair director/organizers; Producers and exhibitors

<td><strong>Develop messages and materials to communicate with the public, media, government officials, and partners about the outbreak and the investigation</strong></td>
</tr>
</tbody>
</table>

**Sample Connection of Roles**

Note: This is an example of the connection of the roles, but it is not meant to capture all possible lines of communication. As you can see in the novel, there are many professionals involved in an outbreak situation. Early planning for how to communicate among and between local teams (e.g., physicians and clinical laboratories), state-level teams, and knowing how to request federal assistance (CDC and USDA) are key elements to initiating an outbreak investigation. Clear protocols for responsibilities including data collection, analysis and communication of results are essential for the investigation to progress efficiently.
