2014-2015 Influenza Season
Week 47 ending November 22, 2014

All data are preliminary and may change as more reports are received.

Synopsis: During week 47 (November 16-22, 2014), influenza activity increased slightly in the United States.

- **Viral Surveillance:** Of 9,710 specimens tested and reported by U.S. World Health Organization (WHO) and National Respiratory and Enteric Virus Surveillance System (NREVSS) collaborating laboratories during week 47, 1,228 (12.6%) were positive for influenza.
- **Pneumonia and Influenza Mortality:** The proportion of deaths attributed to pneumonia and influenza (P&I) was below the epidemic threshold.
- **Influenza-associated Pediatric Deaths:** Four influenza-associated pediatric deaths were reported.
- **Influenza-associated Hospitalizations:** A cumulative rate for the season of 1.1 laboratory-confirmed influenza-associated hospitalizations per 100,000 population was reported.
- **Outpatient Illness Surveillance:** The proportion of outpatient visits for influenza-like illness (ILI) was 2.0%, which is at the national baseline. Four of 10 regions reported ILI at or above region-specific baseline levels. Puerto Rico and one state experienced high ILI activity; two states experienced moderate ILI activity; five states experienced low ILI activity; New York City and 42 states experienced minimal ILI activity; and the District of Columbia had insufficient data.
- **Geographic Spread of Influenza:** The geographic spread of influenza in two states was reported as widespread; Puerto Rico and nine states reported regional activity; 20 states reported local activity; the District of Columbia, the U.S. Virgin Islands, and 17 states reported sporadic activity; two states reported no influenza activity; and Guam did not report.

† Elevated means the % of visits for ILI is at or above the national or region-specific baseline.
§ Includes all 50 states, the District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands.
‡ National data are for current week; regional data are for the most recent three weeks.
**U.S. Virologic Surveillance:** WHO and NREVSS collaborating laboratories located in all 50 states, Puerto Rico, and the District of Columbia report to CDC the number of respiratory specimens tested for influenza and the number positive by influenza virus type and influenza A virus subtype. The results of tests performed during the current week are summarized in the table below.

Influenza Positive Tests Reported to CDC by U.S. WHO/NREVSS Collaborating Laboratories, National Summary, 2014-15
Influenza Virus Characterization*:

CDC has characterized 103 influenza viruses [1 A(H1N1)pdm09, 85 A(H3N2), and 17 influenza B viruses] collected by U.S. laboratories since October 1, 2014.

Influenza A Virus [86]

- **A(H1N1)pdm09 [1]**: The one H1N1 virus tested was characterized as A/California/7/2009-like, the influenza A (H1N1) component of the 2014-2015 Northern Hemisphere influenza vaccine.

- **A(H3N2) [85]**: 41(48%) of the 85 H3N2 viruses tested have been characterized as A/Texas/50/2012-like, the influenza A (H3N2) component of the 2014-2015 Northern Hemisphere influenza vaccine. 44 (52%) of the 85 viruses tested showed either reduced titers with antiserum produced against A/Texas/50/2012 or belonged to a genetic group that typically shows reduced titers to A/Texas/50/2012. Among viruses that showed reduced titers with antiserum raised against A/Texas/50/2012, most were antigenically similar to A/Switzerland/9715293/2013, the H3N2 virus selected for the 2015 Southern Hemisphere influenza vaccine. A/Switzerland/9715293/2013 is related to, but antigenically and genetically distinguishable, from the A/Texas/50/2012 vaccine virus. A/Switzerland-like H3N2 viruses were first detected in the United States in small numbers in March of 2014 and began to increase through the spring and summer.

Influenza B Virus [17]

Ten (58.8%) of the influenza B viruses tested belong to B/Yamagata/16/88 lineage and the remaining seven (41.2%) influenza B viruses tested belong to B/Victoria/02/87 lineage.

- **Yamagata Lineage [10]**: All ten B/Yamagata-lineage viruses were characterized as B/Massachusetts/2/2012-like, which is included as an influenza B component of the 2014-2015 Northern Hemisphere trivalent and quadrivalent influenza vaccines.

- **Victoria Lineage [7]**: All seven B/Victoria-lineage viruses were characterized as B/Brisbane/60/2008-like, the virus that is included as an influenza B component of the 2014-2015 Northern Hemisphere quadrivalent influenza vaccine.

*CDC routinely uses hemagglutination inhibition (HI) assays to antigenically characterize influenza viruses year-round to compare how similar currently circulating influenza viruses are to those included in the influenza vaccine, and to monitor for changes in circulating influenza viruses. However, a portion of recent influenza A(H3N2) viruses do not grow to sufficient hemagglutination titers for antigenic characterization by HI. For many of these viruses, CDC is also performing genetic characterization to infer antigenic properties.
**Antiviral Resistance:** Testing of influenza A(H1N1)pdm09, A(H3N2), and influenza B virus isolates for resistance to neuraminidase inhibitors (oseltamivir and zanamivir) is performed at CDC using a functional assay. Additional A(H1N1)pdm09 and A(H3N2) clinical samples are tested for mutations of the virus known to confer oseltamivir resistance. The data summarized below combine the results of both testing methods. These samples are routinely obtained for surveillance purposes rather than for diagnostic testing of patients suspected to be infected with antiviral-resistant virus.

High levels of resistance to the adamantanes (amantadine and rimantadine) persist among A(H1N1)pdm09 and A(H3N2) viruses (the adamantanes are not effective against influenza B viruses). Therefore, data from adamantane resistance testing are not presented below.

In the United States, all recently circulating influenza viruses have been susceptible to the neuraminidase inhibitor antiviral medications, oseltamivir and zanamivir; however, rare sporadic instances of oseltamivir-resistant A(H1N1)pdm09 and A(H3N2) viruses have been detected worldwide. Antiviral treatment with oseltamivir or zanamivir is recommended as early as possible for patients with confirmed or suspected influenza who have severe, complicated, or progressive illness; who require hospitalization; or who are at high risk for serious influenza-related complications. Additional information on recommendations for treatment and chemoprophylaxis of influenza virus infection with antiviral agents is available at [http://www.cdc.gov/flu/antivirals/index.htm](http://www.cdc.gov/flu/antivirals/index.htm).
**Pneumonia and Influenza (P&I) Mortality Surveillance:** During week 47, 5.3% of all deaths reported through the 122 Cities Mortality Reporting System were due to P&I. This percentage was below the epidemic threshold of 6.4% for week 47.

Pneumonia and Influenza Mortality for 122 U.S. Cities
Week ending November 22, 2014

For the 2014-2015 influenza season, CDC/Influenza Division and the National Center for Health Statistics (NCHS) are collaborating on a pilot project to use NCHS mortality surveillance data for the rapid assessment of pneumonia and influenza (P&I) mortality. To view the data, please click [here](#).
**Influenza-Associated Pediatric Mortality:** Four influenza-associated pediatric deaths were reported to CDC during week 47. Two deaths were associated with an influenza A(H3) virus and occurred during week 46 (week ending November 15, 2014). One death was associated with an influenza A virus for which no subtyping was performed and occurred during week 43 (week ending October 25, 2014). One death was associated with an influenza B virus and occurred during week 46.

**Influenza-Associated Hospitalizations:** The Influenza Hospitalization Surveillance Network (FluSurv-NET) conducts population-based surveillance for laboratory-confirmed influenza-related hospitalizations in children younger than 18 years of age (since the 2003-2004 influenza season) and adults (since the 2005-2006 influenza season).

The FluSurv-NET covers more than 70 counties in the 10 Emerging Infections Program (EIP) states (CA, CO, CT, GA, MD, MN, NM, NY, OR, and TN) and additional Influenza Hospitalization Surveillance Project (IHSP) states. The IHSP began during the 2009-2010 season to enhance surveillance during the 2009 H1N1 pandemic. IHSP sites included IA, ID, MI, OK, and SD during the 2009-2010 season; ID, MI, OH, OK, RI, and UT during the 2010-2011 season; MI, OH, RI, and UT during the 2011-2012 season; IA, MI, OH, RI, and UT during the 2012-2013 season; and MI, OH, and UT during the 2013-2014 and 2014-15 seasons.
Data gathered are used to estimate age-specific hospitalization rates on a weekly basis, and describe characteristics of persons hospitalized with severe influenza illness. The rates provided are likely to be an underestimate as influenza-related hospitalizations can be missed, either because testing is not performed, or because cases may be attributed to other causes of pneumonia or other common influenza-related complications.

Between October 1, 2014 and November 22, 2014, 302 laboratory-confirmed influenza-associated hospitalizations were reported. The overall hospitalization rate was 1.1 per 100,000 population. The highest rate of hospitalization was among adults aged ≥65 years (3.5 per 100,000 population). Among all hospitalizations, 252 (83.4%) were associated with influenza A, 45 (14.9%) with influenza B, 3 (1%) with influenza A and B co-infection, and 2 (0.7%) had no virus type information. Among those with influenza A subtype information, 50 (100%) were A(H3N2) virus.

Outpatient Illness Surveillance: Nationwide during week 47, 2.0% of patient visits reported through the U.S. Outpatient Influenza-like Illness Surveillance Network (ILINet) were due to influenza-like illness (ILI). This percentage is at the national baseline of 2.0%. (ILI is defined as fever (temperature of 100°F [37.8°C] or greater) and cough and/or sore throat.)

Percentage of Visits for Influenza-like Illness (ILI) Reported by the U.S. Outpatient Influenza-like Illness Surveillance Network (ILINet), Weekly National Summary, 2014-2015 and Selected Previous Seasons

On a regional level, the percentage of outpatient visits for ILI ranged from 0.8% to 3.8% during week 47. Four regions (Regions 2, 4, 6, and 10) reported a proportion of outpatient visits for ILI at or above their region-specific baseline levels.
NOTE: Scales differ between regions
*Use of the regional baselines for state data is not appropriate.
**ILINet Activity Indicator Map**: Data collected in ILINet are used to produce a measure of ILI activity* by state. Activity levels are based on the percent of outpatient visits in a state due to ILI and are compared to the average percent of ILI visits that occur during weeks with little or no influenza virus circulation. Activity levels range from minimal, which would correspond to ILI activity from outpatient clinics being below, or only slightly above, the average, to high, which would correspond to ILI activity from outpatient clinics being much higher than average.

During week 47, the following ILI activity levels were experienced:
- Puerto Rico and one state (Louisiana) experienced high ILI activity.
- Two states (Alabama and Texas) experienced moderate ILI activity.
- Five states (Alaska, Florida, Georgia, Idaho and Mississippi) experienced low ILI activity.
  - Data were insufficient to calculate an ILI activity level from the District of Columbia.

*This map uses the proportion of outpatient visits to health care providers for influenza-like illness to measure the ILI activity level within a state. It does not, however, measure the extent of geographic spread of flu within a state. Therefore, outbreaks occurring in a single city could cause the state to display high activity levels.

Data collected in ILINet may disproportionally represent certain populations within a state, and therefore, may not accurately depict the full picture of influenza activity for the whole state.

Data displayed in this map are based on data collected in ILINet, whereas the State and Territorial flu activity map is based on reports from state and territorial epidemiologists. The data presented in this map is preliminary and may change as more data is received. Differences in the data presented here by CDC and independently by some state health departments likely represent differing levels of data completeness with data presented by the state likely being the more complete.
**Geographic Spread of Influenza as Assessed by State and Territorial Epidemiologists:** The influenza activity reported by state and territorial epidemiologists indicates geographic spread of influenza viruses, but does not measure the severity of influenza activity.

During week 47, the following influenza activity was reported:
- Widespread influenza activity was reported by two states (Alaska and Louisiana).
- Regional influenza activity was reported by Puerto Rico and nine states (Alabama, Colorado, Florida, Georgia, Indiana, Maryland, Massachusetts, Minnesota and Texas).
- Local influenza activity was reported by 20 states (Connecticut, Delaware, Illinois, Iowa, Kansas, Michigan, Mississippi, Missouri, Montana, New Hampshire, New York, North Carolina, Ohio, Oklahoma, Pennsylvania, South Carolina, Utah, Vermont, Wisconsin, and Wyoming).
- Sporadic influenza activity was reported by the District of Columbia, U.S. Virgin Islands, and 17 states (Arizona, Arkansas, California, Hawaii, Idaho, Kentucky, Maine, Nebraska, Nevada, New Jersey, New Mexico, North Dakota, Oregon, South Dakota, Tennessee, Washington, and West Virginia).
- No influenza activity was reported by two states (Rhode Island and Virginia).
- Guam did not report.

* This map indicates geographic spread & does not measure the severity of influenza activity.
**Additional National and International Influenza Surveillance Information**

**FluView Interactive:** FluView includes enhanced web-based interactive applications that can provide dynamic visuals of the influenza data collected and analyzed by CDC. These FluView Interactive applications allow people to create customized, visual interpretations of influenza data, as well as make comparisons across flu seasons, regions, age groups and a variety of other demographics. To access these tools, visit [www.cdc.gov/flu/weekly/fluviewinteractive.htm](http://www.cdc.gov/flu/weekly/fluviewinteractive.htm).
