Community-Acquired Pneumonia (CAP) When to Think Fungus: Coccidioidomycosis

Accessible version: https://www.cdc.gov/fungal/diseases/coccidioidomycosis/diagnosticalgorithms

* Initial testing with EIA or ID and CF may depend on availability and performance characteristics of test at facility

- [†] If an EIA test is positive, clinicians can consider follow-up testing with ID and CF to further establish the diagnosis. If ID and CF are negative after a positive EIA test, clinicians can consider repeat ID and CF 2-4 weeks later to confirm diagnosis. Patients with positive EIA results in highly endemic areas or with highly suggestive clinical findings (e.g., erythema nodosa), clinicians might start management for pulmonary coccidioidomycosis while awaiting results from ID or CF.
- [§] False-negative results are possible. If clinical suspicion for coccidioidomycosis continues and if the patient is immunosuppressed or clinical illness is progressing rapidly, consider microscopy and culture of respiratory specimens from a bronchoscopy. Polymerase chain reaction (PCR) and antigen detection can also be helpful but are done less frequently.

U.S. Department of Health and Human Services Centers for Disease Control and Prevention

This product was made in collaboration with the Mycoses Study Group Education & Research Consortium and the Coccidioidomycosis Study Group

Test	Sensitivity	Specificity	Population studied
Antibody tests			
EIA (IgM & IgG) antibody7-9	59%-88%	68%–96% (Cross reacts with other dimorphic fungi)	General patient population, immunocompromised population, patients with disseminated disease
Complement fixation (CF) antibody ^{7,10,11}	65%–83%	High	General patient population, immunocompromised population, patients with disseminated disease
Immunodiffusion (ID) antibody ⁷	60%	99%	General patient population, immunocompromised population, patients with disseminated disease
Lateral flow assay (LFA) antibody ¹²	31%	92%	General patient population
Antigen tests			
EIA urine antigen ^{15,16}	37%–71%	High (but does cross- react with other dimorphic fungi)	General patient population, immunocompromised population, patients with disseminated disease
EIA serum antigen ^{16,17}	51%–73%	High (but does cross- react with other dimorphic fungi)	General patient population, immunocompromised population, patients with disseminated disease
Other tests			
Histopathology⁵	23%–84%	High	General patient population, patients with diabetes, patients with disseminated disease
Cytology⁵	15%–75%	High	General patient population, patients with diabetes, patients with disseminated disease
PCR ^{13,14}	56%–75%	99%–100%	General patient population
