Neglected tropical diseases (NTDs) cause devastating health and economic problems for the world's poorest people, maintaining a cycle of poverty and disease. NTDs cause disability that hinders school attendance, care of families, and earning wages. They disrupt productivity and already unstable economies.

Several NTDs can be controlled or eliminated through straightforward community-level interventions such as mass drug administration (MDA) or simple water filtration. MDA efforts leverage $26 billion in donated drugs. Neglected tropical diseases (NTDs) are a group of preventable and treatable parasitic, viral, and bacterial diseases that affect more than one billion people globally.

**DEMONSTRATED SUCCESS**

Scale up of proven interventions has led to:

- **649 MILLION** people no longer requiring treatment for lymphatic filariasis (LF)
- **1.38 BILLION** people no longer requiring treatment for trachoma
- **LESS THAN 30** Guinea worm infections in 2020, down from 3.5 million in the 1980s

In 2021, **42 COUNTRIES** have **ELIMINATED** at least **1 NTD**
CDC’s EFFORTS
CDC’s Division of Parasitic Diseases and Malaria translates science into action.

Researching better laboratory surveillance tools and making them ready for use by country programs where these diseases are being eliminated

Assisting countries with implementing their programs and using new tools

Providing global scientific leadership on NTD elimination through collaborations with World Health Organization (WHO) and others

SPOTLIGHT ON KEY CDC ACCOMPLISHMENTS AND ACTIVITIES

Developed a new blood test to more easily assess trachoma transmission in a community

Strengthening capacity in labs in Africa

Developing lab-based surveillance strategies, including leading efforts to implement integrated surveillance to detect more than 30 parasitic, viral, and bacterial diseases from a single, small blood sample

Providing support to American Samoa and Haiti to eliminate LF

Using data to strengthen disease elimination efforts for LF, river blindness, and schistosomiasis

Serving as WHO Collaborating Centers for Guinea worm disease and blinding trachoma

WHAT’S NEEDED?

Continue scale up of proven interventions in countries

Expand and strengthen surveillance for data-driven decision making

Develop and deploy new diagnostic tools and approaches

Assist countries that have not yet reached elimination
