PATIENT-CENTERED CARE IMPROVES THE HEALTH OF HIV-INFECTED PREGNANT AND BREASTFEEDING WOMEN: HEALTHY MOTHERS MEANS HEALTHY FAMILIES

OVERVIEW

More than 17.8 million women are living with HIV worldwide and about 900,000 are infected with HIV each year. Tuberculosis (TB) is the leading cause of death among people living with HIV (PHLV) and poses an especially serious risk to pregnant and breastfeeding women and their children. However, with life-saving antiretroviral treatment (ART) and appropriate TB screening and treatment, women with HIV can live long, healthy lives, and have the opportunity to be there for their families. In order to ensure that women and their children can routinely access these HIV and TB services, it is critical that HIV service delivery models are tailored to meet the needs of pregnant and breastfeeding women.

CDC’S ROLE

The U.S. Centers for Disease Control and Prevention (CDC) is a leading agency in the care and treatment of HIV-positive pregnant and breastfeeding women, working hard to provide ART and TB services through patient-centered models that cater to patients’ individual needs, ensuring programs provide quality and respectful holistic care. Below are two projects that highlight this approach to comprehensive and patient-centered services.

Adaptation of the Community Score Card approach to PMTCT in Malawi

Retention in care is critical to prevent mother-to-child transmission of HIV (PMTCT) and prevent HIV-related morbidity and mortality. Data from recent studies show that retention of pregnant and breastfeeding women on ART remains low, hovering between 50-73% with retention dropping even further in postnatal care. Developed originally by CARE Malawi, the Community Score Card (CSC) is a participatory governance approach, which engages community members, service providers, and district officials to improve service delivery. The CSC engages service providers and users within a clinical setting in dialogues to identify solutions to the perceived barriers with health service delivery and utilization. CDC and our partner, the Elizabeth Glaser Pediatric AIDS Foundation, will adapt the CSC to PMTCT settings across 11 sites in Malawi to improve maternal retention on ART and uptake of early infant HIV testing.

Household and Family-Centered Approach to Improve TB and HIV Screening, Diagnosis and Linkage to Care: CDC experts from TB and PMTCT programs are working together in Uganda to enhance TB contact tracing. The World Health Organization recommends contact tracing in order to find, treat, and prevent additional cases of TB; however, it is not routinely done in resource-limited settings. In a country like Uganda that has a substantial burden of undiagnosed TB and a high HIV prevalence (45%) among people with TB, it is important to find and treat all people co-infected with TB and HIV to prevent morbidity and mortality. This project will identify “index cases”, including pregnant and breastfeeding women with TB disease, who may have family members with TB and/or HIV. Community health workers will be sent to their households to screen, test, and treat all family members, as needed.

Focusing on patient-centered care is just one of the strategies that CDC is using to improve PMTCT services worldwide. According to the World Health Organization, “integrated people- [or patient] centered care means putting people and communities, not diseases, at the center of health systems, and empowering people to take charge of their own health rather than being passive recipients of services.” In the past few years, CDC has seen great success utilizing this approach.

Understanding Women’s Preferences for HIV Services
In Ethiopia and Mozambique, CDC and our partners conducted implementation research to better understand the needs and preferences of women attending PMTCT clinics using a novel approach called a discrete choice experiment. These data showed that the two most important aspects of health facilities providing HIV care to HIV-positive women were (1) respectful care by providers and (2) access to non-HIV health services in the same visit. CDC is now working with country staff in multiple countries to identify strategies for promoting respectful care, improving patient engagement, and providing integrated healthcare services within PMTCT programs.

Mentor Mothers
In countries such as Democratic Republic of the Congo, CDC and our partner, the Elizabeth Glaser Pediatric AIDS Foundation, have implemented programs engaging other mothers living with HIV or “Mentor Mothers,” that understand the needs of HIV-positive people and families. The Mentor Mothers are trained to encourage, educate, and empower HIV-positive pregnant women and new mothers about their health and their babies’ health, helping to facilitate their retention in the PMTCT program.

FUTURE EFFORTS

CDC is deeply committed to continuously improving the quality of HIV services to ensure the health of mothers and families. Understanding the needs and preferences of women accessing HIV services in antenatal and postpartum care settings is a critical component of improving patient engagement and satisfaction – and, ultimately, for improving retention in lifelong ART services and helping mothers lead healthy and productive lives. We will continue to conduct operational research to identify how novel strategies for improving patient satisfaction contributes to improved clinical outcomes.

CDC will strive to provide family-centered HIV care, which is comprehensive and coordinated, addresses the needs of adults and children in a family, and attempts to meet social care needs directly or indirectly through strategic partnerships and linkages.

BENEFITS OF OUR WORK

By significantly increasing the number of mothers and children on life-saving antiretroviral treatment (ART), we can dramatically reduce transmission of HIV worldwide and help those living with HIV live longer, healthier lives. CDC has been a forerunner in providing life-long ART to pregnant and breastfeeding women. As an implementing agency of the U.S. President’s Plan for Emergency AIDS Relief (PEPFAR), CDC provides care and treatment services to pregnant women and children and has increased the clinical capacity of local health systems around the world.
