**OREGON ACUTE CARE HOSPITALS**

Healthcare-associated infections (HAIs) are infections patients can get while receiving medical treatment in a healthcare facility. Working toward the elimination of HAIs is a CDC priority. The standardized infection ratio (SIR) is a summary statistic that can be used to track HAI prevention progress over time; lower SIRs are better. The infection data are reported to CDC’s National Healthcare Safety Network (NHSN). HAI data for nearly all U.S. hospitals are published on the Hospital Compare website. This report is based on 2014 data, published in 2016.

---

### CLABSIs

**CENTRAL LINE-ASSOCIATED BLOODSTREAM INFECTIONS**

When a tube is placed in a large vein and not put in correctly or kept clean, it can become a way for germs to enter the body and cause deadly infections in the blood.

- **Oregon hospitals reported a significant increase in CLABSIs between 2013 and 2014.**
- **Among the 25 hospitals in Oregon with enough data to calculate an SIR, 6% had an SIR significantly higher (worse) than 0.50, the value of the national SIR.**

### CAUTIs

**CATHETER-ASSOCIATED URINARY TRACT INFECTIONS**

When a urinary catheter is not put in correctly, not kept clean, or left in a patient for too long, germs can travel through the catheter and infect the bladder and kidneys.

- **Oregon hospitals reported a significant decrease in CAUTIs between 2013 and 2014.**
- **Among the 37 hospitals in Oregon with enough data to calculate an SIR, 8% had an SIR significantly higher (worse) than 1.00, the value of the national SIR.**

### MRSA Bacteremia

**LABORATORY IDENTIFIED HOSPITAL-ONSET BLOODSTREAM INFECTIONS**

Methicillin-resistant *Staphylococcus aureus* (MRSA) is bacteria usually spread by contaminated hands. In a healthcare setting, such as a hospital, MRSA can cause serious bloodstream infections.

- **Oregon hospitals reported no significant change in MRSA bacteremia between 2013 and 2014.**
- **Among the 21 hospitals in Oregon with enough data to calculate an SIR, 0% had an SIR significantly higher (worse) than 0.87, the value of the national SIR.**

### SSIs

**SURGICAL SITE INFECTIONS**

When germs get into an area where surgery is or was performed, patients can get a surgical site infection. Sometimes these infections involve only the skin. Other SSIs can involve tissues under the skin, organs, or implanted material.

- **Oregon hospitals reported no significant change in SSIs related to abdominal hysterectomy surgery between 2013 and 2014.**
- **Not enough data to report how many hospitals had an SIR significantly higher (worse) than 0.83, the value of the national SIR.**
- **Among the 24 hospitals in Oregon with enough data to calculate an SIR, 4% had an SIR significantly higher (worse) than 0.98, the value of the national SIR.**

- **Oregon hospitals reported no significant change in SSIs related to colon surgery between 2013 and 2014.**
- **Among the 24 hospitals in Oregon with enough data to calculate an SIR, 4% had an SIR significantly higher (worse) than 0.98, the value of the national SIR.**
- **Among the 50 hospitals in Oregon with enough data to calculate an SIR, 8% had an SIR significantly higher (worse) than 0.92, the value of the national SIR.**

### C. difficile Infections

**LABORATORY IDENTIFIED HOSPITAL-ONSET C. DIFFICILE INFECTIONS**

When a person takes antibiotics, good bacteria that protect against infection are destroyed for several months. During this time, patients can get sick from *Clostridium difficile* (*C. difficile*), bacteria that cause potentially deadly diarrhea, which can be spread in healthcare settings.

- **Oregon hospitals reported no significant change in *C. difficile* infections between 2013 and 2014.**
- **Among the 50 hospitals in Oregon with enough data to calculate an SIR, 8% had an SIR significantly higher (worse) than 0.92, the value of the national SIR.**

*Statistically significant*
Healthcare-associated infection (HAI) data give healthcare facilities and public health agencies knowledge to design, implement, and evaluate HAI prevention efforts.

† The number of hospitals that reported to NHSN and are included in the SIR calculation. This number may vary across HAI types; for example, some hospitals do not use central lines or urinary catheters, or do not perform colon or abdominal hysterectomy surgeries.

‡ Nat’l baseline time period varies by HAI type. See first column of this table for specifics.

### WHAT IS THE STANDARDIZED INFECTION RATIO? (SIR)

The standardized infection ratio (SIR) is a summary statistic that can be used to track HAI prevention progress over time; lower SIRs are better. The SIR for a facility or state is adjusted to account for factors that might cause infection rates to be higher or lower, such as hospital size, teaching status, the type of patients a hospital serves, and surgery and patient characteristics.

### WHAT IS OREGON DOING TO PREVENT HEALTHCARE-ASSOCIATED INFECTIONS?

Oregon has a state mandate to publicly report at least one HAI to NHSN. Oregon is one of 10 state health departments participating in CDC’s Emerging Infections Program, which allows for extra surveillance and research of HAIs.

Prevention efforts to reduce specific HAIs:

- Catheter-associated urinary tract infections
- Multidrug-resistant infections (C. difficile, CRE, other)

For prevention effort details, see glossary.

For additional data points, refer to the technical data tables.
