Data from the 2015 National Youth Risk Behavior Survey (YRBS) show that students with higher academic grades are less likely to be currently sexually active or to have drunk alcohol or used drugs before their last sexual intercourse, and more likely to have used a condom the last time they had sexual intercourse. Students with higher grades were also less likely to have been tested for HIV. It is important to remember that these associations do not prove causation. School health professionals, school officials, and other decision makers can use this information to better understand the associations between adolescent sexual behaviors and grades, as well as to develop and reinforce policies, practices, and programs that support healthy decision-making around sexual behaviors.

Key findings

Compared to students with lower grades, students with higher grades are

- less likely to:
  - Be currently sexually active.
  - Have drunk alcohol or used drugs before their last sexual intercourse.
  - Have been tested for HIV.

- more likely to:
  - Have used a condom during last sexual intercourse.

**Figure 1A** and **Figure 1B** illustrate the percentage of students who engaged in each risk behavior, by type of grades mostly earned in school (mostly A’s, B’s, C’s, D’s/F’s) (row proportions). The percentage of students who did not engage in each risk behavior are not shown. However, the percentages of students who did and did not engage in each risk behavior, by type of grades mostly earned in school, sum to 100%. Logistic regression analyses (not shown) controlling for sex, race/ethnicity, and grade in school confirmed a significant association between sexual risk behaviors and academic grades. You can also view data from other 2015 YRBS sexual behavior variables.

**Summary**

- 23% of US high school students with mostly A’s were currently sexually active (had sexual intercourse with at least one person during the 3 months before the survey), compared to 46% of students with mostly D/F’s.

- 14% of currently sexually active US high school students with mostly A’s drank alcohol or used drugs before their last sexual intercourse, compared to 41% of students with mostly D/F’s.

*Among currently sexually active students.

However, the percentages of students who did and did not engage in each risk behavior, by type of grades mostly earned in school, sum to 100%. Logistic regression analyses (not shown) controlling for sex, race/ethnicity, and grade in school confirmed a significant association between sexual risk behaviors and academic grades. You can also view data from other 2015 YRBS sexual behavior variables.
Summary

7% of US high school students with mostly A’s were ever tested for HIV (not counting tests done when donating blood), compared to 15% of students with mostly D/F’s.

61% of currently sexually active US high school students with mostly A’s used a condom during last sexual intercourse, compared to 41% of students with mostly D/F’s.

Conclusions

These results from the YRBS provide evidence of a significant association between academic grades and sexual behaviors and HIV testing status. Further research is warranted to determine whether higher grades in school lead to certain sexual behaviors and HIV testing status, if certain sexual behaviors and HIV testing status lead to higher grades, or some other factors lead to these sexual and HIV testing behaviors.

There is a close relationship between health and education. By working together, education and health agencies, parents, and communities can ensure that students are healthy and ready to learn in school.

About the Data

The National YRBS monitors priority health-risk behaviors that contribute to the leading causes of death, disability, and social problems among youth and adults in the United States. It is conducted every 2 years during the spring and provides data representative of 9th through 12th grade students in public and private schools throughout the nation. In 2015, students completing the YRBS were asked, “During the past 12 months, how would you describe your grades in school?” and given seven response options (Mostly A’s, Mostly B’s, Mostly C’s, Mostly D’s, Mostly F’s, None of these grades, Not sure). In 2015, 32% of students received mostly A’s, 38% received mostly B’s, 20% received mostly C’s, 6% received mostly D’s or F’s, and 4% reported receiving none of these grades or not sure.
