## Checklist to Review Successful Incorporation of the HICPAC Principles of Antimicrobial Stewardship in Clinical Treatment Guidelines

Introduction: Clinical Treatment Guideline writing groups can use this checklist while reviewing and editing their Guidelines to assure successful incorporation of the <a href="https://example.com/HICPAC Principles of Antimicrobial Stewardship into their Guidelines">HICPAC Principles of Antimicrobial Stewardship into their Guidelines</a>.

1) Professional societies and guideline developers should incorporate the principles of diagnostic			
testing and treatment directly into the recommendations included in their treatment			
guidelines. Recommendations for diagnostic testing and treatment choices should consider			
optimal effective treatment, minimal adverse consequences including the development of			
antibiotic resistance, and healthcare value.			
a. Principles of Testing			
i. Diagnostic tests should be used wisely to avoid unnecessary antibiotic therapy or therapy			
that is unnecessarily broad-spectrum, with consideration of healthcare value.			
ii. Rapid diagnostic tests, biomarkers, and decision rules that have acceptable performance			
characteristics to differentiate bacterial vs. non-bacterial infection should be used to avoid use			
of unnecessary antibiotic therapy.			
iii. Bacterial cultures with susceptibility testing should be collected, handled and processed			
promptly and appropriately to identify specific bacteria causing infection and facilitate use of			
narrow-spectrum antibiotics whenever possible.			
iv. When available and appropriate for the infection and the bacterial isolate, molecular			
testing to identify specific resistance genes (for example, mec in Staphylococcus, van in			
Enterococcus) or novel non-culture based phenotypic assays of susceptibility may be used to			
target antibiotic therapy toward susceptible or resistant isolates.			
v. Avoid diagnostic testing without an appropriate clinical indication when the results may			
have unintended consequences. For instance, a urine culture, rapid strep test, or C. difficile			
testing should not be performed unless the patient meets criteria for testing.			
b. Principles of Treatment			
i. When appropriate for the infection, source removal (e.g., drainage of abscess, removal of an			
implicated device) should be accomplished early in the course of treatment.			
ii. Recommendations for initial empiric antibiotic therapy choices should balance treatment			
efficacy, severity of illness (i.e., sepsis), and the potential for adverse events including the			
development of antibiotic resistance. When multiple therapeutic options are available, a			
hierarchy of antibiotic treatment recommendations should be provided with "first choice"			
options being those with adequate therapeutic efficacy, the lowest risk of facilitating			
antimicrobial resistance, and the lowest risk of promoting C. difficile and other adverse			
events, with consideration of healthcare value.			
iii. Recommendations for optimal dosing of antibiotics should be based on efficacy studies and			
pharmacokinetic and pharmacodynamics principles.  iv. Recommendations for duration of therapy should be made, emphasizing the shortest			
,,			
effective duration.			
v. Recommendations for de-escalation of initial empiric antibiotic therapy should be provided,			
including:			
Using the results of bacterial cultures and diagnostic tests to discontinue or narrow			
unnecessarily broad-spectrum antibiotic therapy.			
2. Using other stewardship tools, such as consultation with an antibiotic stewardship team			
and/or infectious diseases specialist, daily review of antibiotic therapy, and automatic stop			
orders after adequate treatment duration.			
vi. Potential adverse events related to antibiotic treatment should be noted in the guideline so			
that providers may opt not to prescribe an antibiotic, or to choose a recommended agent that			
has a lower potential for adverse events.			
2) Professional societies and guideline developers should consider presenting advantages and			
disadvantages of diagnostic tests and antibiotic treatment choices with respect to efficacy and			
adverse consequences, including antibiotic resistance, with consideration of healthcare value,			
either in the text or a table.			
3) Recommendations for patient education regarding diagnostic testing, antibiotic therapy, and			
duration of therapy should be provided when feasible and appropriate.
