In 2015, youth aged 13 to 24 accounted for 22% of all new HIV diagnoses in the United States. Most of those new diagnoses among youth (81%) occurred among gay and bisexual males. Young black/African American and Hispanic/Latino gay and bisexual males are especially affected; however, we are seeing progress. Estimated annual HIV infections fell 18% among young gay and bisexual males from 2008 to 2014.

Youth with HIV are the least likely out of any age group to be linked to care and have a suppressed viral load (that is, having a very low level of the virus in the body, which helps the person stay healthy and greatly reduces the risk of transmitting HIV to others). Addressing HIV in youth requires that we give young people the information and tools they need to reduce their risk, make healthy decisions, and get treatment and care if needed.

The Numbers

New Infections and Diagnoses

- Estimated annual HIV infections declined 18% among young gay and bisexual males from 2008 to 2014.
- In 2015, 8,807 youth were diagnosed with HIV in the United States. Eighty percent (7,084) of those diagnoses occurred in persons aged 20 to 24.
- Among youth diagnosed with HIV in 2015, 81% (7,109) were gay or bisexual males. Of newly diagnosed males, 55% (3,888) were black, 24% (1,672) were Hispanic/Latino, and 16% (1,159) were white.
- In 2015, 1,489 youth were diagnosed with AIDS, representing 8% of total AIDS diagnoses that year.

Living With HIV and Deaths

- At the end of 2013, an estimated 60,900 youth were living with HIV in the United States. Of these, 51% (31,300) were living with undiagnosed HIV—the highest rate of undiagnosed HIV in any age group.
- Among youth who were diagnosed with HIV in 2014, 68% were linked to care within 1 month—the lowest rate of any age group.\(^e\)
- Among youth who were diagnosed with HIV in 2012 or earlier, 55% were retained in HIV care and 44% had a suppressed viral load—the lowest rate of viral suppression for any age group.
- In 2014, 117 youth aged 15 to 24 died from HIV.

Prevention Challenges

Inadequate Sex Education. The status of sexual health education varies throughout the United States and is insufficient in many areas according to CDC’s 2014...
Gay and bisexual high school students may engage in risky sexual behaviors and substance abuse because they feel isolated and lack support. They are more likely than heterosexual youth to experience bullying and other forms of violence, which homophobia can pose obstacles to utilizing HIV prevention services, testing, and treatment.

In the 2015 YRBS, 34% of gay, lesbian, or bisexual high school students who had sexual contact with other males did not use a condom the last time they had sexual intercourse. Only 21% have ever been tested for HIV. Among male students who had sexual contact with other males, only 21% have ever been tested for HIV.

Substance use. Nationwide, 21% of all students who are currently sexually active (had sexual intercourse during the previous 3 months) and 32% of male students who had sexual contact with other males drank alcohol or used drugs before their most recent sexual intercourse.

Low rates of condom use. Nationwide, nearly half (43%) of all sexually active high school students and 49% of male students who had sexual contact with other males did not use a condom the last time they had sexual intercourse.

Number of partners. One-third (33%) of male students who had sexual contact with other males reported sexual intercourse with 4 or more persons during their life, compared to 12% of all students who had ever had sexual contact.

High rates of testing. Only 10% of high school students have been tested for HIV. Among male students who had sexual contact with other males, only 21% have ever been tested for HIV.

Low rates of condom use. Nationwide, nearly half (43%) of all sexually active high school students and 49% of male students who had sexual contact with other males did not use a condom the last time they had sexual intercourse.

Number of partners. One-third (33%) of male students who had sexual contact with other males reported sexual intercourse with 4 or more persons during their life, compared to 12% of all students who had ever had sexual contact.

What CDC Is Doing

CDC funds state and local health departments (https://www.cdc.gov/hiv/funding/announcements/ps12-1201/index.html) to develop and implement HIV prevention programs in the communities most affected by HIV.

CDC awarded (https://www.cdc.gov/hiv/funding/announcements/ps11-1113/index.html) $11 million per year for 5 years, beginning in 2011, to community-based organizations to provide HIV testing to young gay and bisexual men and young transgender persons of color, with the goals of identifying previously unrecognized HIV infections and linking those who have HIV to care and prevention services. A new funding opportunity (https://www.cdc.gov/hiv/funding/announcements/ps17-1704/index.html) focusing on this population will begin in 2017 and continue for 5 years, depending on the availability of funds.

CDC’s Division of Adolescent and School Health collects and reports data on youth health risk behaviors (https://www.cdc.gov/yrbs) and funds state and local education agencies (https://www.cdc.gov/healthyyouth/partners/index.htm) and nongovernmental organizations (https://www.cdc.gov/healthyyouth/partners/funded_ngos.htm) to help schools deliver health education emphasizing HIV/STD prevention, increase teen access to health services, and establish safe and supportive environments for students. For example:

- Advocates for Youth (http://www.advocatesforyouth.org/) assists state and local education agencies with implementing programs to meet the HIV/STD prevention needs of young gay and bisexual men.

- The National Coalition of STD Directors (http://www.ncsccd.org/) works with state education agencies, and Cicatelli Associates Inc. (CAI) (http://www.caiglobal.org/) works with local education agencies to increase adolescent access to preventive health services.

- The American Psychological Association (http://www.apa.org/) works with state education agencies, and the Gay-Straight Alliance Network (https://gsanetwork.org/) works with local education agencies to establish safe and supportive learning environments for students and staff.

- CDC’s Act Against AIDS (https://www.cdc.gov/actagainstaids/index.html) initiative focuses on raising awareness about HIV, fighting stigma, and reducing the risk of HIV infection among at-risk populations through campaigns such as Doing It (https://www.cdc.gov/actagainstaids/campaigns/doingit/index.html), which motivates individuals to get tested for HIV and know their status.
