

Volume 29

Diagnoses of HIV Infection in the United States and Dependent Areas, 2017

National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention Division of HIV/AIDS Prevention The *HIV Surveillance Report* is published annually by the Division of HIV/AIDS Prevention, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention, Centers for Disease Control and Prevention (CDC), U.S. Department of Health and Human Services, Atlanta, Georgia.

Data are presented for diagnoses of HIV infection reported to CDC through June 2018.

The *HIV Surveillance Report* is not copyrighted and may be used and reproduced without permission. Citation of the source is, however, appreciated.

Acknowledgments

Publication of this report would not have been possible without the contributions of the state and territorial health departments and the HIV surveillance programs that provided surveillance data to CDC.

This report was prepared by the following CDC staff and contractors: Kristen Hess, Shacara Johnson, Xiaohong Hu, Jianmin Li, Baohua Wu, Chenchen Yu, Hong Zhu, Chan Jin, Mi Chen, John Gerstle, Marie Morgan, Michael Friend, Anna Satcher Johnson, Azfar Siddiqi, Angela Hernandez, the HIV Incidence and Case Surveillance Branch, and the Data Management Team of the Quantitative Sciences and Data Management Branch.

The Centers for Disease Control and Prevention (CDC) collects, analyzes, and disseminates surveillance data on HIV infection; these data are one of the nation's primary sources of information on HIV in the United States. The annual surveillance report, published by the Division of HIV/AIDS Prevention, summarizes information about diagnosed HIV infection in the United States and dependent areas. HIV surveillance data are used by CDC's public health partners in other federal agencies, health departments, nonprofit organizations, academic institutions, and the general public to help focus prevention efforts; plan services; allocate resources; develop policy; detect, monitor, and intervene in HIV clusters; and monitor trends in HIV infection.

Numbers and rates of diagnoses of HIV infection during 2012–2016 and preliminary numbers for 2017 are based on data from all 50 states, the District of Columbia, and 6 U.S. dependent areas (American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands).

During 2012–2016, the annual rate of diagnoses of HIV infection in the United States decreased; the annual number of diagnoses remained stable. Numbers and rates of diagnoses of HIV infection increased in some subgroups and decreased in others. Variations in trends among groups are expected and may be due to differences in testing behaviors, targeted HIV testing initiatives, or changes in the numbers of new HIV infections (incidence) in some subgroups. (For slide sets of trends among selected populations [2010–2016], see Additional Resources.)

REPORT CHANGES

In response to our partners' requests for expanded data, the 2017 report includes tables that provide data on diagnoses and stage 3 (AIDS) classifications among adults and adolescents, by year (2012–2017), sex, and selected characteristics.

- For diagnosis data (United States/United States and dependent areas), see Tables 5a/b.
- For stage 3 (AIDS) classification data (United States/United States and dependent areas), see Tables 6a/b.

DEFINITIONS AND DATA SPECIFICATIONS

The term *diagnosis of HIV infection* is defined as a diagnosis of HIV infection regardless of the stage of disease (stage 0, 1, 2, 3 [AIDS], or unknown) and refers to all persons with a diagnosis of HIV infection. The term HIV infection, stage 3 (AIDS) and its condensed version-stage 3 (AIDS)-refer specifically to persons with diagnosed HIV whose infection was classified as stage 3 (AIDS) during a given year (for diagnoses) or whose infection has ever been classified as stage 3 (AIDS) (for prevalence and deaths). The 2008 surveillance case definition for HIV infection was used to classify cases diagnosed through 2013. The 2014 revised surveillance case definition was used to classify cases diagnosed after 2013. For more information on HIV surveillance case definitions and the stages of HIV infection, please review the Technical Notes.

The data on diagnoses of HIV infection reflect the date of diagnosis (diagnosed by December 31, 2017; reported to CDC as of June 30, 2018), not the date of report to CDC. Similarly, the data specific to stage 3 (AIDS) reflect the first date the criteria for stage 3 (AIDS) were met. HIV diagnoses do not necessarily reflect when a person became infected. HIV surveillance data may not be representative of all persons infected with HIV because not all infected persons have been (1) tested or (2) tested at a time when their infection could be detected and diagnosed. Because of reporting delays, the number of cases diagnosed in a given year may be lower than the numbers presented in later reports; however, fluctuations in the number of diagnoses for a calendar year typically subside after 2 to 3 years of reporting.

HIGHLIGHTS OF ANALYSES

All rates are per 100,000 population. The standard used for reporting trends in numbers and rates is an increase or a decrease of 5% or more during the specified time frame (e.g., when comparing 2012 and 2016). Exceptions to this standard were made where numbers were small or rates were based on small numbers. The HIV diagnosis and stage 3 (AIDS) classification data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay and therefore should not be included when assessing trends.

Please read all table titles and footnotes carefully to ensure a complete understanding of the displayed data.

Diagnoses of HIV Infection and Diagnoses of Infection Classified as Stage 3 (AIDS)

Diagnoses of HIV infection

From 2012 through 2016, the rate of diagnoses of HIV infection in the United States decreased; the annual number of diagnoses remained stable (Table 1a). In 2017, the rate was 11.8.

- Age group: From 2012 through 2016, the rate for persons aged 25–29 years increased. The rates for children (aged less than 13 years) and persons aged 13–14, 15–19, 40–44, 45–49, 50– 54, 55–59, 60–64 years, and 65 years and older decreased. The rates for persons aged 20–24, 30–34, and 35–39 years remained stable. In 2017, the highest rate (32.9) was for persons aged 25–29 years, followed by the rate (28.7) for persons aged 20–24 years.
- Race/ethnicity: From 2012 through 2016, the rates for American Indians/Alaska Natives and Asians increased. The rates for blacks/African Americans, Native Hawaiians/other Pacific Islanders, whites, and persons of multiple races decreased. The rates for Hispanics/Latinos remained stable. In 2017, the highest rate was 41.1 for blacks/African Americans, followed by 16.1 for Hispanics/Latinos, 12.6 for persons of multiple races, 9.9 for Native Hawaiians/other Pacific Islanders, 8.8 for American Indians/Alaska Natives, and 5.1 for both Asians and whites.
- Sex: From 2012 through 2016, the rates for male and female adults and adolescents decreased. In 2017, males accounted for 81% of all diagnoses of HIV infection among adults and adolescents. The 2017 rate for male adults and adolescents was 23.1; the 2017 rate for females was 5.2.
- **Transmission category**: From 2012 through 2016, among male adults and adolescents, the annual number of diagnosed HIV infections attributed to injection drug use, to male-to-male sexual contact *and* injection drug use, or to heterosexual contact decreased. The number of infec-

tions attributed to male-to-male sexual contact remained stable. Among female adults and adolescents, the number of infections attributed to injection drug use or to heterosexual contact decreased. In 2017, among all adults and adolescents, the diagnosed infections attributed to maleto-male sexual contact (70%, including 3% maleto-male sexual contact *and* injection drug use) and those attributed to heterosexual contact (24%) accounted for approximately 94% of diagnosed HIV infections in the United States.

• **Region**: From 2012 through 2016, the rates of diagnoses of HIV infection in the Northeast and the Midwest decreased. The rates in the South and the West remained stable. In 2017, rates were 16.1 in the South, 10.6 in the Northeast, 9.4 in the West, and 7.4 in the Midwest.

Stage 3 (AIDS)

From 2012 through 2016, the annual number and the rate of infections classified as stage 3 (AIDS) in the United States decreased (Table 2a). In 2017, the rate of infections classified as stage 3 (AIDS) was 5.4.

- Age group: Because of the change in case definition in 2014, the trend among children (aged less than 13 years) was not assessed. From 2012 through 2016, the rates for all other age groups decreased. In 2017, the highest rate (11.1) was for persons aged 30–34 years, followed by the rate (10.4) for persons aged 35–39 years. Please use caution when interpreting data for children (aged less than 13 years) and persons aged 13–14 years: the numbers are small.
- Race/ethnicity: From 2012 through 2016, the rate for American Indians/Alaska Natives increased. The rates for all other race/ethnicity groups decreased. In 2017, the highest rate was 20.5 for blacks/African Americans, followed by 9.3 for persons of multiple races, 6.6 for Hispanics/ Latinos, 4.7 for Native Hawaiians/other Pacific Islanders, 3.0 for American Indians/Alaska Natives, 2.2 for whites, and 1.8 for Asians.
- Sex: From 2012 through 2016, the rates for male and female adults and adolescents decreased. In 2017, males accounted for 76% of all infections classified as stage 3 (AIDS) among adults and adolescents. The 2017 rate for males was 10.0; the 2017 rate for females was 3.0.

- **Transmission category**: From 2012 through 2016, the annual number of infections classified as stage 3 (AIDS) among male adults and adolescents with HIV infection attributed to male-to-male sexual contact, to injection drug use, to male-to-male sexual contact *and* injection drug use, or to heterosexual contact decreased. The number of infections classified as stage 3 (AIDS) among female adults and adolescents with HIV infection attributed to injection drug use or to heterosexual contact decreased. Please use caution when interpreting data for children with infection attributed to perinatal transmission: the numbers are small.
- **Region**: From 2012 through 2016, the rates of infections classified as stage 3 (AIDS) in the 4 regions of the United States decreased. In 2017, rates were 7.6 in the South, 5.3 in the Northeast, 3.9 in the West, and 3.3 in the Midwest.

Deaths

Deaths of persons with diagnosed HIV infection

From 2012 through 2016 in the United States, the rate of deaths of persons with diagnosed HIV infection decreased; the number of deaths remained stable (Table 18a). In 2016, the rate of deaths of persons with diagnosed HIV infection was 4.8. Deaths of persons with diagnosed HIV infection may be due to any cause (i.e., may or may not be related to HIV infection).

- Age group: From 2012 through 2016, the rates of deaths for persons aged 60–64 and 65 years and older increased. The rates of deaths for persons aged 20–24, 30–34, 35–39, 40–44, 45–49, and 50–54 years decreased. The rates for persons aged 25–29 and 55–59 years remained stable. Please use caution when interpreting data for children (aged less than 13 years at death) and persons aged 13–14 and 15–19 years: the numbers are small.
- **Race/ethnicity**: From 2012 through 2016, the rates of deaths for American Indians/Alaska Natives, blacks/African Americans, and Hispanics/Latinos decreased. The rates for Asians, whites, and persons of multiple races remained stable. In 2016, the highest rate of deaths was for blacks/African Americans: 16.9.

Please use caution when interpreting data for Native Hawaiians/other Pacific Islanders: the numbers are small.

- Sex and transmission category: From 2012 through 2016, the rates of deaths for male and female adults and adolescents decreased. The number of deaths among males with diagnosed HIV infection attributed to injection drug use or to perinatal transmission decreased. The numbers of deaths among males attributed to male-to-male sexual contact, male-to-male sexual contact and injection drug use, or heterosexual contact remained stable. The number of deaths among female adults and adolescents with infection attributed to perinatal transmission increased. The number of deaths among females with infection attributed to injection drug use or to heterosexual contact decreased. Please use caution when interpreting data for children with infection attributed to perinatal transmission: the numbers are small.
- **Region**: From 2012 through 2016, the rates of deaths in the Northeast, the Midwest, and the South decreased. The rates of deaths in the West remained stable. In 2016, rates were 6.4 in the Northeast, 6.1 in the South, 3.4 in the West, and 2.5 in the Midwest.

Deaths of persons with infection ever classified as stage 3 (AIDS)

From 2012 through 2016 in the United States, the annual number and rate of deaths of persons with infection ever classified as stage 3 (AIDS) decreased (Table 19a). In 2016, the rate of deaths of persons with stage 3 (AIDS) was 3.8. Deaths of persons with stage 3 (AIDS) may be due to any cause.

- Age group: From 2012 through 2016, the rates of deaths among persons aged 60–64 and 65 years and older increased. Rates of deaths among persons aged 20–24, 25–29, 30–34, 35–39, 40–44, 45–49, and 50–54 years decreased. Rates among persons aged 55–59 years remained stable. Please use caution when interpreting data for children (aged less than 13 years) and persons aged 13–14 and 15–19 years: the numbers are small.
- **Race/ethnicity**: From 2012 through 2016, the rates of deaths for American Indians/Alaska Natives, blacks/African Americans, and Hispanics/Latinos decreased. The rates of deaths

for Asians, whites, and persons of multiple races remained stable. In 2016, the highest death rate was for blacks/African Americans: 13.4. Please use caution when interpreting data for Native Hawaiians/other Pacific Islanders: the numbers are small.

- Sex and transmission category: From 2012 through 2016, the rates of deaths for male and female adults and adolescents decreased. The numbers of deaths among males with infection attributed to injection drug use or to perinatal transmission decreased. The numbers of deaths among males with infection attributed to male-tomale sexual contact, male-to-male sexual contact and injection drug use, or heterosexual contact remained stable. The number of deaths among female adults and adolescents with infection attributed to perinatal transmission increased. Among female adults and adolescents with infection attributed to injection drug use or to heterosexual contact, the number of deaths decreased. Please use caution when interpreting data for children with infection attributed to perinatal transmission: the numbers are small.
- **Region**: From 2012 through 2016, the rates of deaths in the Northeast, the Midwest, and the South decreased; the rate in the West remained stable. In 2016, rates were 5.1 in the Northeast, 4.9 in the South, 2.8 in the West, and 2.0 in the Midwest.

Prevalence: Persons Living with Diagnosed HIV Infection and Persons Living with Infection Ever Classified as Stage 3 (AIDS)

Prevalence of diagnosed HIV infection

From 2012 through 2016, the number and rate of persons in the United States living with diagnosed HIV infection increased (Table 22a). At year-end 2016, 991,447 persons in the United States were living with diagnosed HIV infection. The prevalence of diagnosed HIV infection was 306.6.

• Age group: At year-end 2016, persons aged 50– 54 years made up the largest percentage (17%) of persons living with diagnosed HIV. The highest rate (777.6) was among persons aged 50–54 years, followed by those aged 45–49 (661.6) and those aged 55–59 (630.1). From 2012 through 2016, the largest percentage increase in rates (56%) was among persons aged 65 years and older (from 104.4 in 2012 to 162.6 in 2016).

- Race/ethnicity: At year-end 2016, the highest rate (1,026.6) and the largest percentage (42%) were those for blacks/African Americans. Among the remaining race/ethnicity groups, the rates were 628.4 for persons of multiple races, 372.1 for Hispanics/Latinos, 152.8 for whites, 150.4 for Native Hawaiians/other Pacific Islanders, 124.0 for American Indians/Alaska Natives, and 76.3 for Asians.
- Sex and transmission category: At year-end 2016, the rates were 570.1 for male adults and adolescents, 169.9 for female adults and adolescents, and 4.2 for children (aged less than 13 years at year-end 2016). Among a total of 754,218 males (aged 13 years and older at year-end 2016), 72% of infections were attributed to male-to-male sexual contact, 10% to heterosexual contact, 10% to injection drug use, 7% to male-to-male sexual contact and injection drug use, and 1% to perinatal transmission. Among a total of 235,004 females (aged 13 years and older at year-end 2016), 76% of infections were attributed to heterosexual contact, 21% to injection drug use, and 2% to perinatal transmission. Among a total of 2,225 children aged less than 13 years at year-end 2016, 81% of infections were attributed to perinatal transmission.
- **Region**: At year-end 2016, the rate was highest in the Northeast at 418.8, followed by 361.3 in the South, 253.7 in the West, and 174.5 in the Midwest.

Prevalence of stage 3 (AIDS)

From 2012 through 2016, the number of persons living with infection ever classified as stage 3 (AIDS) increased; the rate remained stable (Table 23a). At year-end 2016, 525,374 persons in the United States were living with infection ever classified as stage 3 (AIDS). The prevalence of infections classified as stage 3 (AIDS) was 162.5.

• Age group: At year-end 2016, the highest rate (480.2) and the largest percentage (20%) were those for persons aged 50–54 years, followed by persons aged 55–59 (405.2 and 17%, respectively). From 2012 through 2016, the largest per-

centage increase in rates (54%) was among persons aged 65 years and older (from 70.0 in 2012 to 107.6 in 2016).

- Race/ethnicity: At year-end 2016, the highest rate (538.8) and the largest percentage (41%) were those for blacks/African Americans. Among the remaining race/ethnicity groups, the rates were 366.8 for persons of multiple races, 206.0 for Hispanics/Latinos, 79.0 for whites, 73.7 for Native Hawaiians/other Pacific Islanders, 62.3 for American Indians/Alaska Natives, and 35.5 for Asians.
- Sex and transmission category: At year-end 2016, the rates were 303.0 for male adults and adolescents, 89.8 for female adults and adolescents, and 0.5 for children (aged less than 13 years at year-end 2016). Among a total of 400,859 males (aged 13 years and older at yearend 2016), 67% of infections were attributed to male-to-male sexual contact, 12% to injection drug use, 12% to heterosexual contact, 8% to male-to-male sexual contact and injection drug use, and 1% to perinatal transmission. Among a total of 124,228 females (aged 13 years and older at year-end 2016), 72% of infections were attributed to heterosexual contact, 24% to injection drug use, and 2% to perinatal transmission. Among a total of 287 children aged less than 13 years at year-end 2016, 86% of infections were attributed to perinatal transmission.
- **Region**: At year-end 2016, the rate was highest in the Northeast at 237.0, followed by 185.7 in the South, 137.1 in the West, and 87.4 in the Midwest.

SURVEILLANCE OF HIV INFECTION

This report includes case report data from 50 states, the District of Columbia, and 6 U.S. dependent areas (American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands) in which laws or regulations require confidential reporting to the jurisdiction (not to CDC), by name, for adults, adolescents, and children with confirmed diagnoses of HIV infection. After the removal of personally identifiable information, data from these reports were submitted to CDC. Although AIDS cases have been reported to CDC since 1981, the date of implementation of HIV infection reporting has differed from jurisdiction to jurisdiction. All states, the District of Columbia, and 6 U.S. dependent areas had fully implemented namebased HIV infection reporting by April 2008.

Please use caution when interpreting data on diagnoses of HIV infection. HIV surveillance reports may not be representative of all persons with HIV because not all infected persons have been (1) tested or (2) tested at a time when the infection could be detected and diagnosed. Also, some states offer anonymous HIV testing; the results of anonymous tests are not reported to the confidential name-based HIV registries of state and local health departments. Therefore, reports of confidential test results may not represent all persons who tested positive for HIV infection. In addition, testing patterns are influenced by many factors, including the extent to which testing is routinely offered to specific groups and the availability of, and access to, medical care and testing services. The data presented in this report provide minimum counts of persons for whom HIV infection has been diagnosed and reported to the surveillance system. Finally, although all jurisdictions use a uniform case report form, surveillance practices in data collection and updating of case records may differ among jurisdictions.

Based on annual standard evaluation results, the completeness of reporting of HIV infection, as of December 2017, is estimated to be at least 85% in all but 1 jurisdiction [1].

STAGES OF HIV INFECTION

Both the 2008 and 2014 HIV case definitions were used to classify HIV infection among adults and adolescents and among children [2, 3]. In the following lists, some bulleted items are paraphrases, not quotations from the published surveillance case definitions. The intention is to emphasize the differences between the 2008 and 2014 case definitions.

The 2008 case definition was used to classify cases diagnosed through 2013. For adults and adolescents, this definition incorporates an HIV infection staging system that includes AIDS (HIV infection, stage 3). The 2008 stages of HIV infection are defined as follows:

- HIV infection, stage 1: No AIDS-defining opportunistic illness (OI) and either CD4+ Tlymphocyte (CD4 lymphocyte) count of ≥500 cells/µL or CD4 percentage of total lymphocytes of ≥29.
- **HIV infection, stage 2**: No AIDS-defining OI and either CD4 lymphocyte count of 200–499 cells/µL or CD4 percentage of total lymphocytes of 14–28.
- HIV infection, stage 3 (AIDS): Documentation of an AIDS-defining OI or either a CD4 lymphocyte count of <200 cells/µL or CD4 percentage of total lymphocytes of <14. Documentation of an AIDS-defining OI supersedes a CD4 lymphocyte count or percentage that would not, by itself, be the basis for a stage 3 (AIDS) classification.
- HIV infection, stage unknown: No reported information on AIDS-defining OIs and no information available on CD4 lymphocyte count or percentage.

The 2014 case definition was used to classify cases diagnosed after 2013. It is similar to the 2008 case definition except for the following: (1) inclusion of criteria for stage 0, (2) the inclusion of CD4 lymphocyte testing criteria for stage 3 in children, and (3) changes in the cutoffs for CD4 percentage of total lymphocytes used for classification of stages 1 and 2 in persons aged 6 years and older [3]. The stages of HIV infection in the 2014 case definition are based on agespecific CD4 lymphocyte counts or percentages of total lymphocytes and are defined as follows:

- HIV infection, stage 0: Negative (nonreactive) or indeterminate HIV-1 test result within 6 months before the first positive (reactive) HIV-1 test result, or a negative or an indeterminate HIV-1 antibody test result within 6 months before or after the first positive HIV-1 nucleic acid test result (if the latter was not the first positive HIV test). The stage remains stage 0 during the 6 months after the first positive test result; after 6 months, the stage is reclassified, depending upon CD4 lymphocyte test results (stage 1, 2, or 3), the diagnosis of an AIDS-defining OI (stage 3), or the absence of reported CD4 or OI information (stage unknown).
- HIV infection, stages 1, 2, and 3: Documentation of an AIDS-defining OI (excluding stage 0 as described above) is stage 3. Otherwise, the stage is determined by the lowest CD4 lymphocyte test result [3, p 7].
- **HIV infection, stage unknown**: No reported information on AIDS-defining OIs and no information available on CD4 lymphocyte count or percentage.

The transition to CD4 lymphocyte-based criteria for stage 3 (AIDS) among children has resulted in an increase in the number of annual stage 3 (AIDS) classifications among pediatric cases diagnosed after 2013. Before implementation of the 2014 revised case definition, an OI diagnosis was required for a pediatric case to meet the criteria for stage 3 classification.

In this report, the term *diagnosis of HIV infection* is defined as a diagnosis of HIV infection regardless of the stage of disease (stage 0, 1, 2, 3 [AIDS], or unknown) and refers to all persons with a diagnosis of HIV infection. The term HIV infection, *stage 3 (AIDS)* and its condensed version—*stage 3 (AIDS)*—refer specifically to persons with diagnosed HIV whose infection was classified as stage 3 (AIDS) during a given year (for diagnoses) or whose infection has ever been classified as stage 3 (AIDS) (for prevalence and deaths).

TABULATION AND PRESENTATION OF DATA

The data in this report include information received by CDC through June 30, 2018. The data are organized into 4 sections.

- Section 1 (Tables 1a/b–17): numbers and rates of diagnoses of HIV infection (any stage) and diagnoses of infection classified as stage 3 (AIDS)
- Section 2 (Tables 18a/b–21a/b): numbers and rates of deaths among persons with diagnosed HIV infection (any stage) and persons with infection ever classified as stage 3 (AIDS)
- Section 3 (Tables 22a/b–25a/b): numbers and rates of persons living with diagnosed HIV infection (any stage) and persons living with infection ever classified as stage 3 (AIDS) (i.e., prevalence)
- Section 4 (Tables 26–31): numbers and rates of diagnoses and prevalence of HIV infection (any stage) and diagnoses and prevalence of infection classified as stage 3 (AIDS), presented by state and metropolitan statistical area (MSA)

Many tables in the 2017 report present data in 2 formats. Tables in the first format—labeled "a"—exclude data from the dependent areas (American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands). Tables in the second format—labeled "b"—include data from the dependent areas.

Please use caution when interpreting numbers less than 12, and rates and trends based on these numbers.

Numbers of diagnoses for the most recent year (2017) are considered preliminary. Please use caution when interpreting these numbers, and do not include them when assessing trends.

Diagnoses of HIV Infection and Stage 3 (AIDS) Classifications

This report is based on diagnoses of HIV infection that the 50 states, the District of Columbia, and 6 U.S. dependent areas reported to CDC as of June 30, 2018. Data from all areas are included in tables displaying numbers and rates of diagnoses of HIV infection and of stage 3 (AIDS) classifications, by selected characteristics, area of residence, and MSA (Tables 1a/b–17, 26, 27, 30, and 31). For tables presenting diagnosis data, region or area of residence reflects the address at the time of HIV diagnosis or at the time of stage 3 (AIDS) classification.

Deaths

Persons reported to the National HIV Surveillance System are assumed alive unless their deaths have been reported to CDC. Death data include deaths of persons with diagnosed HIV infection (Tables 18a/b and 20a/b) or with infection ever classified as stage 3 (AIDS) (Tables 19a/b and 21a/b) regardless of the cause of death. Because of delays in the reporting of deaths, only 5 years (2012–2016) of death data are displayed. The exclusion of data from the most recent year allowed at least 18 months for deaths to be reported to CDC. For the death tables, region or area of residence is based on residence at death. When information on residence at death is not available, the state where a person's death occurred is used.

Prevalence: Persons Living with Diagnosed HIV Infection and Persons Living with Infection Ever Classified as Stage 3 (AIDS)

Because of delays in the reporting of deaths, only 5 years of prevalence data are displayed. The data reflect persons living with diagnosed HIV infection, regardless of stage of disease, (Tables 22a/b, 24a/b, 28, and 30) and persons living with infection ever classified as stage 3 (AIDS) (Tables 23a/b, 25a/b, 29, and 31) at the end of a given year during 2012–2016. The exclusion of data from the most recent year allowed at least 18 months for deaths to be reported and for these deaths to be factored into calculations of prevalence. For tables presenting prevalence data, region or area of residence is based on most recent known address as of the end of the specified year.

Age

The designation "adults and adolescents" refers to persons aged 13 years and older; the designation "children" refers to persons aged less than 13 years. For presentations of data on persons living with diagnosed HIV infection (Tables 22a/b, 24a/b, and 28) and presentations of data on persons living with infection classified as stage 3 (AIDS) (Tables 23a/b, 25a/b, and 29), the age-group assignment (e.g., 20–24 years) or the age designation (e.g., "adults and adolescents") is based on the person's age as of December 31 of the specified year. For presentations of data on deaths of persons with diagnosed HIV infection (Tables 18a/b and 20a/b) and deaths of persons with infection classified as stage 3 (AIDS) (Tables 19a/b and 21a/b), agegroup assignment is determined by the person's age at the time of death. For all other tables, the age designation or the specific age-group assignment is based on the person's age at the time of HIV diagnosis or at the time of stage 3 (AIDS) classification.

Age-group designations for transmission categories in tables displaying data on prevalence and on deaths are based on a person's age at the end of the specified year or age at death, respectively. The transmission categories among "adults and adolescents" in these tables include persons who were children at the time of diagnosis but who were aged 13 years and older during the specified year or at death.

Sex

Sex designations in this report are based on a person's sex at birth. Transgender is an umbrella term that is used to identify persons whose sex assigned at birth does not match current gender identity or expression. Data for transgender persons are not presented in this report because information on gender identity (a person's internal understanding of his or her gender or the gender with which a person identifies) is not consistently collected or documented in the data sources used by HIV reporting jurisdictions. HIV surveillance personnel collect data on gender identity, when available, from sources such as case report forms submitted by health care or HIV testing providers and medical records, or by matching with other health department databases (e.g., Ryan White program data). In May 2012, CDC issued guidance to state and local programs on methods for collecting data on transgender persons and working with transgender-specific data. However, characterization of HIV infection among transgender persons may require supplemental data from special studies.

Race and Ethnicity

In the *Federal Register* [4] for October 30, 1997, the Office of Management and Budget (OMB) announced the Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity. Implementation by January 1, 2003, was mandated. At a minimum, data on the following race categories should be collected:

- American Indian or Alaska Native
- Asian
- black or African American
- Native Hawaiian or other Pacific Islander
- white

Additionally, systems must be able to retain information when multiple race categories are reported. In addition to data on race, data on 2 categories of ethnicity should be collected:

- Hispanic or Latino
- not Hispanic or Latino

The Asian or Pacific Islander category displayed in annual surveillance reports published prior to the 2007 surveillance report was split into 2 categories: (1) Asian and (2) Native Hawaiian or other Pacific Islander. The Asian category (in tables where footnoted) includes the cases in Asians/Pacific Islanders (referred to as legacy cases) that were reported before the implementation of the new race categories in 2003 (e.g., cases of HIV infection that were diagnosed and reported to CDC before 2003 but that were classified as stage 3 [AIDS] after 2003) and a small percentage of cases that were reported after 2003 but that were reported according to the old race category (Asian/ Pacific Islander). In tables of diagnoses of HIV infection during 2012–2017, the Asian category does not include Asian/Pacific Islander cases because these cases were diagnosed after 2003 and were reported to CDC in accordance with OMB's Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity [4].

This report also presents data for persons for whom multiple race categories are reported. In this report, persons categorized by race were not Hispanic or Latino. The number of persons reported in each race category may, however, include persons whose ethnicity was not reported.

Geographic Designations

Data by region or area of residence reflect the address at the time of diagnosis of HIV infection or at the time of stage 3 (AIDS) classification for tables that present number of diagnoses (Tables 1a/b–17, 26, 27, 30, 31). For tables presenting prevalence data (22a/b–25a/b, 28–31), region or area of residence is based on most recent known address as of the end of the specified year. For the death tables (18a/b–21a/b), region or area of residence is based on residence at death. When information on residence at death is not available, the state where a person's death occurred is used.

The 4 regions of residence used in this report are defined by the U.S. Census Bureau as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont

Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming

U.S. dependent areas: American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the U.S. Virgin Islands

Metropolitan Statistical Areas

In the *Federal Register* for June 28, 2010, OMB published revised standards for defining MSAs in federal statistical activities [5]. These standards, which provided for the identification of MSAs in the United States and Puerto Rico, replaced the 2000 standards. The adoption of the new standards was effective as of June 28, 2010. On February 28, 2013, OMB announced new MSA delineations based on the new standards and Census 2010 data [6]. Tables 30 (data on diagnosed HIV infection) and 31 (data on stage 3 [AIDS]) present numbers and rates of diagnoses and prevalence, by MSA, for areas with populations of 500,000 or more. The MSAs listed in these tables were defined according to OMB's most recent update (February 2013) of statistical areas [6].

Transmission Categories

Transmission category is the term for the classification of cases that summarizes a person's possible HIV risk factors; the summary classification results from selecting, from the presumed hierarchical order of probability, the 1 (single) risk factor most likely to have been responsible for transmission. For surveillance purposes, a diagnosis of HIV infection is counted only once in the hierarchy of transmission categories. Persons with more than 1 reported risk factor for HIV infection are classified in the transmission category listed first in the hierarchy. The exception is men who had sexual contact with other men and injected drugs; this group makes up a separate transmission category.

Persons whose transmission category is classified as male-to-male sexual contact include men who have ever had sexual contact with other men (i.e., homosexual contact) and men who have ever had sexual contact with both men and women (i.e., bisexual contact). Persons whose transmission category is classified as heterosexual contact are persons who have ever had heterosexual contact with a person known to have, or to be at high risk for, HIV infection (e.g., a person who injects drugs). The heterosexual contact category excludes men who have ever had sexual contact with both men and women.

Tables of prevalence data and tables of death data include a separate transmission category of adults and adolescents with HIV infection attributed to perinatal transmission. The category includes persons infected through perinatal transmission but aged 13 years and older during the specified year or at death.

Cases of HIV infection reported without a risk factor listed in the hierarchy of transmission categories are classified as "no identified risk (NIR)." Cases classified as NIR include cases that are being followed up by local health department staff; cases in persons whose risk-factor information is missing because they died, declined to be interviewed, or were lost to follow-up; and cases in persons who were interviewed or for whom other follow-up information was available but for whom no risk factor was identified.

Because a substantial proportion of cases of HIV infection are reported to CDC without an identified risk factor, multiple imputation is used to assign a transmission category [7]. Multiple imputation is a statistical approach in which each missing transmission category is replaced with a set of plausible values that represent the uncertainty about the true, but missing, value [8]. Each resulting data set containing the plausible values is analyzed by using standard procedures, and the results from these analyses are then combined to produce the final results. In tables displaying transmission categories, multiple imputation was used for adults and adolescents, but not for children (because the number of cases in children is small, missing transmission categories were not imputed).

Rates

Rates per 100,000 population were calculated for (1) the numbers of diagnoses of HIV infection and the numbers of infections classified as stage 3 (AIDS), (2) the numbers of deaths of persons with diagnosed HIV infection and deaths of persons with infection ever classified as stage 3 (AIDS), and (3) the numbers of persons living with diagnosed HIV infection and persons living with infection ever classified as stage 3 (AIDS).

The population denominators used to compute the rates for the 50 states, the District of Columbia, and Puerto Rico were based on the Vintage 2017 postcensal estimates file (for years 2012–2017) from the U.S. Census Bureau [9]. The population denominators for American Samoa, Guam, the Northern Mariana Islands, the Republic of Palau, and the U.S. Virgin Islands were based on estimates and projections from the U.S. Census Bureau's International Data Base [10]. Each rate was calculated by dividing the total number of diagnoses (or deaths or prevalence) for the calendar year by the population for that calendar year and then multiplying the result by 100,000. The denominators used for calculating the rates specific to age, sex, and race/ethnicity were computed by applying the appropriate vintage estimates for age, sex, and race/ethnicity for the 50 states and the District of Columbia [9]. The same method was used to calculate the denominators for Puerto Rico, with the exception of race/ethnicity estimates; these data are not available for Puerto Rico (see next paragraph). For the other 5 U.S. dependent areas, estimates from the U.S. Census Bureau's International Data Base were used for ageand sex-specific population denominators [10].

CDC currently does not provide subpopulation rates by race/ethnicity for the 6 U.S. dependent areas because the U.S. Census Bureau does not collect information from all dependent areas. Rates for transmission categories are not provided in this report because of the absence of denominator data from the U.S. Census Bureau, the source of data used for calculating all rates in this report.

Data for the year 2017 should not be used when assessing trends.

^a Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

^b Hispanics/Latinos can be of any race.

^C Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

 $^{\rm d}$ Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^e Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

f Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^g Data are based on residence at time of diagnosis of HIV infection.

Data for the year 2017 should not be used when assessing trends.

^a Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited. Rates are not calculated by transmission category because of the lack of denominator data.

^b Hispanics/Latinos can be of any race.

^C Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

d Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^e Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

f Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^g Data are based on residence at time of diagnosis of HIV infection.

Data for the year 2017 should not be used when assessing trends.

Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a From the beginning of the epidemic through 2017.

^b Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

^C The criteria for stage 3 (AIDS) classification among pediatric cases were expanded in 2014 (see Technical Notes).

^d Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^e Hispanics/Latinos can be of any race.

f Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

^g Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^h Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

ⁱ Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^j Data are based on residence at time of stage 3 (AIDS) classification.

k Cumulative total includes persons whose race/ethnicity is unknown.

Table 5a. Diagnoses of HIV infection among adults and adolescents, by year of diagnosis, sex, and selected characteristics, 2012–2017— United States

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends. Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a Rates are per 100,000 population.

^b Hispanics/Latinos can be of any race.

^C Data are based on residence at time of diagnosis of HIV infection.

Table 5b. Diagnoses of HIV infection among adults and adolescents, by year of diagnosis, sex, and selected characteristics, 2012–2017— United States and 6 dependent areas

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends. Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited.

^b Hispanics/Latinos can be of any race.

^c Data are based on residence at time of diagnosis of HIV infection.

Table 6b. Stage 3 (AIDS) among adults and adolescents, by year of diagnosis, sex, and selected characteristics, 2012–2017—United States and 6 dependent areas

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends. Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited.

b Hispanics/Latinos can be of any race.

^C Data are based on residence at time of stage 3 (AIDS) classification.

Table 7a. Diagnoses of HIV infection attributed to male-to-male sexual contact and male-to-male sexual contact *and* injection drug use, by selected characteristics, 2012–2017—United States (cont)

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends.

Numbers less than 12, and trends based on these numbers, should be interpreted with caution.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of diagnosis of HIV infection.

^b Hispanics/Latinos can be of any race.

Table 7b. Diagnoses of HIV infection attributed to male-to-male sexual contact and male-to-male sexual contact and injection drug use, by selected characteristics, 2012–2017—United States and 6 dependent areas (cont)

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends.

Numbers less than 12, and trends based on these numbers, should be interpreted with caution.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of diagnosis of HIV infection.

^b Hispanics/Latinos can be of any race.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of diagnosis of HIV infection.

Table 8b. Diagnoses of HIV infection attributed to injection drug use, by selected characteristics, 2012–2017—United States and 6 dependent areas (cont)

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends. Numbers less than 12, and trends based on these numbers, should be interpreted with caution.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of diagnosis of HIV infection.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

Persons whose transmission category is classified as heterosexual contact are persons who have ever had heterosexual contact with a person known to have, or to be at high risk for, HIV infection (e.g., a person who injects drugs). The heterosexual contact category excludes men who have ever had sexual contact with both men and women.

^a Data are based on residence at time of diagnosis of HIV infection.

Table 9b. Diagnoses of HIV infection attributed to heterosexual contact, by selected characteristics, 2012–2017—United States and 6 dependent areas (cont)

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends. Numbers less than 12, and trends based on these numbers, should be interpreted with caution.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

Persons whose transmission category is classified as heterosexual contact are persons who have ever had heterosexual contact with a person known to have, or to be at high risk

for, HIV infection (e.g., a person who injects drugs). The heterosexual contact category excludes men who have ever had sexual contact with both men and women.

 $^{\rm a}$ Data are based on residence at time of diagnosis of HIV infection.

Table 10a. Stage 3 (AIDS) attributed to male-to-male sexual contact and male-to-male sexual contact and injection drug use, by selected characteristics, 2012–2017—United States (cont)

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends.

Numbers less than 12, and trends based on these numbers, should be interpreted with caution.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of stage 3 (AIDS) classification.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

| characteristics, 2012–2017—United States and 6 dependent areas (cont) |

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of stage 3 (AIDS) classification.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of stage 3 (AIDS) classification.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

^a Data are based on residence at time of stage 3 (AIDS) classification.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

Persons whose transmission category is classified as heterosexual contact are persons who have ever had heterosexual contact with a person known to have, or to be at high risk for, HIV infection (e.g., a person who injects drugs). The heterosexual contact category excludes men who have ever had sexual contact with both men and women.

^a Data are based on residence at time of stage 3 (AIDS) classification.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

Note. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay. Data for the year 2017 should not be used when assessing trends. Numbers less than 12, and trends based on these numbers, should be interpreted with caution.

Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column total.

Persons whose transmission category is classified as heterosexual contact are persons who have ever had heterosexual contact with a person known to have, or to be at high risk for, HIV infection (e.g., a person who injects drugs). The heterosexual contact category excludes men who have ever had sexual contact with both men and women.

^a Data are based on residence at time of stage 3 (AIDS) classification.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^C Hispanics/Latinos can be of any race.

Note. Deaths of persons with a diagnosis of HIV infection may be due to any cause.

Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a From the beginning of the epidemic through 2016.

^b Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

^C Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^d Hispanics/Latinos can be of any race.

^e Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

^f Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^g Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^h Data are based on residence at death. When information on residence at death was not available, state at death (where a person's death occurred) was used.

ⁱ Includes persons whose race/ethnicity is unknown.

Note. Deaths of persons with a diagnosis of HIV infection may be due to any cause.

Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a From the beginning of the epidemic through 2016.

^b Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited. Rates are not calculated by transmission category because of the lack of denominator data.

^C Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^d Hispanics/Latinos can be of any race.

^e Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

^f Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^g Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^h Data are based on residence at death. When information on residence at death was not available, state at death (where a person's death occurred) was used.

ⁱ Includes persons whose race/ethnicity is unknown.

Note. Deaths of persons with a diagnosis of HIV infection may be due to any cause.

Numbers less than 12 should be interpreted with caution.

^a Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^b Hispanics/Latinos can be of any race.

^c Includes persons whose race/ethnicity is unknown.

^d Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

^e Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^f Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^g Data are based on residence at death. When information on residence at death was not available, state at death (where a person's death occurred) was used.

^a Rates are per 100,000 population. Rates are not calculated by transmission category because of the lack of denominator data.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^C Hispanics/Latinos can be of any race.

^d Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

^e Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^f Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^g Data are based on address of residence at the end of the specified year (i.e., most recent known address).

^h Includes persons whose race/ethnicity is unknown.

^a Rates are per 100,000 population. Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited. Rates are not calculated by transmission category because of the lack of denominator data.

^b Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^C Hispanics/Latinos can be of any race.

^d Data have been statistically adjusted to account for missing transmission category; therefore, values may not sum to column subtotals and total.

^e Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^f Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^g Data are based on address of residence at the end of the specified year (i.e., most recent known address).

^h Includes persons whose race/ethnicity is unknown.

Note. Data are based on address of residence at the end of the specified year (i.e., most recent known address). Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay.

Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a Rates are per 100,000 population.

Note. Data are based on address of residence at the end of the specified year (i.e., most recent known address).

Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay.

Numbers less than 12, and rates and trends based on these numbers, should be interpreted with caution.

^a From the beginning of the epidemic through 2017.

^b Rates are per 100,000 population.

Note. Data are based on address of residence at the end of the specified year (i.e., most recent known address).

Numbers less than 12, and rates based on these numbers, should be interpreted with caution

^a Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^b Hispanics/Latinos can be of any race.

^c Includes persons whose race/ethnicity is unknown.

^d Rates are per 100,000 population.

^e Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited.

Table 29. Adults and adolescents living with diagnosed HIV infection ever classified as stage 3 (AIDS), by race/ethnicity and area of residence, year-end 2016-United States and 6 dependent areas (cont)

Note. Data are based on address of residence at the end of the specified year (i.e., most recent known address).

Numbers less than 12, and rates based on these numbers, should be interpreted with caution.

^a Includes Asian/Pacific Islander legacy cases (see Technical Notes).

^b Hispanics/Latinos can be of any race.

^c Includes persons whose race/ethnicity is unknown.

^d Rates are per 100,000 population.

^e Rates by race/ethnicity are not provided because U.S. census information for U.S. dependent areas is limited.

Table 30. Diagnoses of HIV infection, 2017, and persons living with diagnosed HIV infection (prevalence), yearend 2016, by metropolitan statistical area of residence—United States and Puerto Rico (cont)

Abbreviation: MSA, metropolitan statistical area.

Note. Because of the lack of U.S. census information for all U.S. dependent areas, table includes data for only the United States and Puerto Rico. Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay.

Numbers less than 12, and rates based on these numbers, should be interpreted with caution.

MSA definitions for this report can be found at http://www.census.gov/programs-surveys/metro-micro.html.

^a Data are based on residence at time of diagnosis of HIV infection.

^b Data are based on address of residence at the end of the specified year (i.e., most recent known address).

^C Rates are per 100,000 population.

^d Based on rate.

^e Counts of diagnoses of HIV infection for the metropolitan divisions do not sum to the MSA total. MSA total includes data from 1 metropolitan division with population of <500,000.

^f Includes persons whose county of residence is unknown.

Table 31. Stage 3 (AIDS), 2017 and cumulative, and persons living with diagnosed HIV infection ever classified as stage 3 (AIDS) (prevalence),

Abbreviation: MSA, metropolitan statistical area.

Note. Because of the lack of U.S. census information for all U.S. dependent areas, table includes data for only the United States and Puerto Rico.

Data for the year 2017 are considered preliminary because they are based on only a 6-month reporting delay.

Numbers less than 12, and rates based on these numbers, should be interpreted with caution.

MSA definitions for this report can be found at http://www.census.gov/programs-surveys/metro-micro.html.

^a From the beginning of the epidemic through 2017.

^b Data are based on residence at time of diagnosis of HIV infection.

^C Data are based on address of residence at the end of the specified year (i.e., most recent known address).

^d Rates are per 100,000 population.

^e Based on rate.

^f Counts of stage 3 (AIDS) classifications for the metropolitan divisions do not sum to the MSA total. MSA total includes data from 1 metropolitan division with population of <500,000.

^g Includes persons whose county of residence is unknown.
