More than 6,000 people died from HIV in 2014. 53% were in the South.

Reduce Your Risk

- Not having sex
- Using condoms
- Not sharing needles
- Taking medicine to prevent or treat HIV

HIV IS A VIRUS THAT ATTACKS THE BODY’S IMMUNE SYSTEM.

It is usually spread by anal or vaginal sex or sharing needles with a person who is living with HIV. The only way to know you have HIV is to be tested. Everyone aged 13-64 should be tested at least once, and people at high risk should be tested at least once a year. Ask your doctor, or visit gettested.cdc.gov to find a testing site. Without treatment, HIV can make a person very sick or may even cause death. If you are living with HIV, start treatment as soon as possible to stay healthy and help protect your partners.
