OF THE 37,832 NEW HIV DIAGNOSES IN THE US AND DEPENDENT AREAS* IN 2018:

- 69% WERE AMONG GAY AND BISEXUAL MEN†
- 24% WERE AMONG HETEROSEXUALS**
- 7% WERE AMONG PEOPLE WHO INJECT DRUGS (PWID)††

New HIV Diagnoses in the US and Dependent Areas for the Most-Affected Subpopulations, 2018

From 2010 to 2017, HIV diagnoses decreased 11% overall.+++ But trends varied for different groups of people:

- Gay and bisexual men:† remained stable
- Heterosexuals: ** down 25%
- People who inject drugs: †† down 29%

* American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, the Republic of Palau, and the US Virgin Islands.
† Includes infections attributed to male-to-male sexual contact and injection drug use (men who reported both risk factors).
‡ This fact sheet uses the term gay and bisexual men to represent gay, bisexual, and other men who have sex with men.
** Does not include heterosexuals who reported injection drug use.
†† Does not include infections attributed to male-to-male sexual contact and injection drug use (men who reported both risk factors).
+++ In 50 states and the District of Columbia.
Around 1.1 million people are living with HIV in the US.††† People with HIV need to know their HIV status so they can take medicine to treat HIV. Taking HIV medicine as prescribed can make the level of virus in their body very low (called viral suppression) or even undetectable.

For every 100 people with HIV in 2016:†††

- 64 received some HIV care
- 49 were retained in care
- 53 were virally suppressed

A person with HIV who takes HIV medicine as prescribed and gets and stays virally suppressed or undetectable can stay healthy and has effectively no risk of sexually transmitting HIV to HIV-negative partners.

Reduce Your Risk

- Not having sex
- Using condoms
- Not sharing syringes
- Taking medicine to prevent or treat HIV

HIV IS A VIRUS THAT ATTACKS THE BODY’S IMMUNE SYSTEM.

It is usually spread by anal or vaginal sex or sharing syringes with a person who has HIV. The only way to know you have HIV is to be tested. Everyone aged 13-64 should be tested at least once, and people at high risk should be tested at least once a year. Ask your doctor, or visit gettested.cdc.gov to find a testing site. Without treatment, HIV can make a person very sick or may even cause death. If you have HIV, start treatment as soon as possible to stay healthy and help protect your partners.
