Guidance for Clinicians
Caring for Patients after a Tick Bite

When a patient seeks care after a tick bite, topics to discuss should include:

- Tick removal
- Lyme disease prophylaxis
- Symptom watch

How to Remove a Tick

1. Use fine-tipped tweezers to grasp the tick as close to the skin's surface as possible.
2. Pull upward with steady, even pressure. Don't twist or jerk the tick.
3. After removing the tick, thoroughly clean the bite area and your hands with rubbing alcohol or soap and water.

Kill a live tick by putting it in rubbing alcohol or placing it in a sealed bag/container. Save the tick for species identification and degree of tick engorgement (important when determining eligibility for Lyme disease prophylaxis).

Table 1. Lyme disease post-exposure prophylaxis dosages.

<table>
<thead>
<tr>
<th>Age Category</th>
<th>Drug</th>
<th>Dosage</th>
<th>Maximum</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adults</td>
<td>Doxycycline</td>
<td>200 mg orally</td>
<td>N/A</td>
<td>Once</td>
</tr>
<tr>
<td>Children weighing less than 45 kg</td>
<td>Doxycycline</td>
<td>4.4 mg/kg orally</td>
<td>200 mg</td>
<td>Once</td>
</tr>
</tbody>
</table>

In certain circumstances, a single dose of doxycycline can lower the risk of Lyme disease when:

- The tick bite occurred in a state where Lyme disease incidence is high (Figure 1) or in an area where >20% of ticks are infected with *Borrelia burgdorferi*. Contact your local health department for information about tick infection rates in your area.
- The attached tick can be identified as an adult or nymphal blacklegged tick (Figure 2).
- The estimated time of attachment is ≥36 hours based on the degree of tick engorgement with blood or likely time of exposure to the tick (Figure 3).
- Prophylaxis can be started within 72 hours of tick removal.
- The patient has no contraindication to doxycycline.

References

NOTE: Antibiotic prophylaxis has not been shown to prevent tickborne disease other than Lyme disease and is not recommended for prevention of anaplasmosis, babesiosis, ehrlichiosis, or Rocky Mountain spotted fever.
Symptom watch

Encourage patients to watch for fever, rash, or flu-like illness in the weeks after a tick bite. Location of tick exposure can guide the differential diagnosis.

If a person is suspected of acute tickborne disease, including early Lyme disease or Rocky Mountain spotted fever, initiate treatment as soon as possible, rather than waiting for laboratory results, which may be insensitive in early illness.
