¹ Abbreviations: QD=once a day, BID=twice a day, TID=three times a day, QID=four times a day, h=hour(s), po=by mouth, IV=intravenous, tab(s)=tablet(s).

² If an antimalarial taken for chemoprophylaxis, a different drug should be used for treatment.

³ Option A preferred, Options B and C adequate alternatives and should be used if more readily available than Option A. Option D should be used only if other options not available.

⁴ Not to exceed adult dose.

⁵ Administer with food to improve absorption

⁶ Artemether-lumefantrine can be used in pregnancy. Not for infants <5 kg or women breastfeeding infants <5 kg.

⁷ Atovaquone-proguanil not recommended during pregnancy, in infants <5 kg, or in women breastfeeding infants <5 kg. May be considered if other treatment options not available or not tolerated, and benefits outweigh risks.

Table 1. (continued) Uncomplicated malaria: *P. falciparum* or unknown species (If later diagnosed as *P. vivax* or *P. ovale*, see Table 2 for additional treatment needed)

⁸ Quinine to be given for 3 days, except for infections acquired in Southeast Asia where 7 days of treatment required. Quinine available in the US has 324 mg (salt) per capsule; therefore, 2 capsules for adult dosing. Pediatric dosing may need compounding pharmacy.

⁹ Doxycycline or tetracycline combined with quinine preferred due to more efficacy data, but not recommended during pregnancy or in children <8 years old unless no other options and benefits outweigh risks.

 $^{^{10}}$ Clindamycin with quinine preferred option for pregnant women and children <8 years old.

¹¹ Mefloquine not recommended for infections acquired in Southeast Asia due to drug resistance. Not recommended if other options available or in patients with neuropsychiatric history.

¹² Regimens used to treat chloroquine-resistant P. falciparum infections may be used if chloroquine and hydroxychloroquine not available.

¹ Abbreviations: QD=once a day, BID=twice a day, TID=three times a day, QID=four times a day, h=hour(s), po=by mouth, IV=intravenous, tab(s)=tablet(s).

² If an antimalarial taken for chemoprophylaxis, a different drug should be used for treatment.

³ Not to exceed adult dose.

⁴ Regimens used to treat chloroquine-resistant *P. vivax* infections may be used if chloroquine and hydroxychloroquine not available.

⁵ Either option for antirelapse treatment recommended if chloroquine or hydroxychloroquine used for acute treatment. If regimens other than either chloroquine or hydroxychloroquine used for acute treatment, primaquine is the only option for antirelapse treatment.

⁶ Primaquine and tafenoquine associated with hemolytic anemia in those with glucose-6-phosphate dehydrogenase (G6PD) deficiency. Prior to use, quantitative G6PD testing needed to confirm normal activity. For those with intermediate G6PD deficiency, weekly primaquine may be used (45 mg per week) for 8 weeks with close monitoring for hemolysis. Those with G6PD deficiency may be given chloroquine 300 mg (base) po weekly for 1 year from acute infection to prevent relapses.

⁷ Primaquine and tafenoquine must not be used during pregnancy; pregnant patients with *P. vivax* and *P. ovale* infections should receive chloroquine 300 mg (base) po weekly after acute treatment for the remainder of pregnancy. After delivery, patients with normal G6PD activity can be given primaquine or tafenoquine depending on breastfeeding, or continue with chloroquine prophylaxis for a total of 1 year from acute infection. Primaquine can be used during breastfeeding if infant found to also have normal G6PD activity; tafenoquine not recommended during breastfeeding.

⁸ Dose of primaquine in patients ≥70 kg should be adjusted to a total dose of 6 mg/kg, divided into doses of 30 mg per day.

⁹ Tafenoquine can only be used if chloroquine or hydroxychloroquine administered for acute treatment due to limited data on efficacy when used in combination with other regimens.

 $^{^{2}}$ If an antimalarial taken for chemoprophylaxis, a different drug should be used for treatment.

³ Atovaquone-proguanil not listed due to insufficient data on its safety during pregnancy but may be considered if other treatment options not available or not tolerated, and benefits outweigh risks.

⁴ Artemether-lumefantrine can be used in all trimesters in pregnancy per WHO evidence review and policy.

⁵ Quinine to be given for 3 days for *P. falciparum* and *P. vivax* infections, except for *P. falciparum* infections acquired in Southeast Asia where 7 days of treatment required.

Table 5: Severe malaria^{1,2,3,4,5}

Species and Drug Susceptibility (Based on where acquired)	Recommended Adult Regimen	Recommended Pediatric Regimen
All species, drug susceptibility not relevant for acute	IV artesunate: Commercially available from major distributors. 1 dose=2.4 mg/kg	
treatment of severe malaria	IV doses (3 in total) at 0, 12 and 24 hours	
If P. vivax or P. ovale infections, in addition to acute treatment listed here, antirelapse	PLUS follow-on treatment below	
treatment needed (Table 2)	If IV artesunate not readily available, give oral antimalarials while obtaining IV artesunate. When IV artesunate arrives, discontinue oral antimalarial and initiate IV treatment. Interim treatment options (Table 1 for dosing): Artemather-lumefantrine (Coartem®) (preferred): or	
	 Artemether-lumefantrine (Coartem®) (preferred); or Atovaquone-proguanil (Malarone™); or Quinine sulfate; or Mefloquine (only if no other options available) If oral therapy not tolerated, consider administration via nasogastric (NG) tube or after an antiemetic.	
	Reassess parasite density at least 4 hours after the third dose: Parasite density ≤1% and patient able to tolerate oral medications: Give a complete follow-on oral regimen. Options include (Table 1 for dosing): • Artemether-lumefantrine (Coartem®) (preferred), or • Atovaquone-proguanil (Malarone™), or • Quinine plus doxycycline or, in children <8 years old and pregnant women, clindamycin, or • Mefloquine (only if no other options available)	
	Parasite density >1%: Continue IV artesunate, same dose, QD up to 6 more days (for a total of 7 days of IV artesunate) until parasite density ≤1%. When parasite density ≤1%, give complete follow-on oral regimen (Table 1 for options and dosing).	
	Parasite density ≤1% but patient unable to take oral medication: Continue IV artesunate, same dose, QD up to 6 more days (for a total of 7 days of IV artesunate) until patient able to take oral therapy.	

¹ Abbreviations: QD=once a day, BID=twice a day, TID=three times a day, QID=four times a day, h=hour(s), po=by mouth, IV=intravenous, tab(s)=tablet(s).

 $^{^{2}\,\}mathrm{If}$ an antimalarial taken for chemoprophylaxis, a different drug should be used for treatment.

³ Laboratory-confirmed or suspected malaria cases with ≥1 clinical criteria for severe disease (impaired consciousness/convulsions/coma, severe anemia [hemoglobin <7mg/dl], acute kidney injury, acute respiratory distress syndrome, circulatory shock, disseminated intravascular coagulation, acidosis, jaundice [plus at least one other sign]); and/or parasite density ≥5%. Information on how to estimate parasite density available at www.cdc.gov/dpdx.

⁴ Parasite density should be repeated every 12–24 hours until negative.

⁵ Exchange transfusion no longer recommended based on a systematic review of the literature and analysis of US malaria surveillance data showing no added benefit.

Use of trade names is for identification only and does not imply endorsement by [the Centers for Disease Control and Prevention/the Agency for Toxic Substances and Disease Registry], the Public Health Service, or the U.S. Department of Health and Human Services.
