

MALARIA

is spread by the bite of an infective female *Anopheles* mosquito. The disease can cause fever, chills, and flu-like illness. If it is not treated, it can cause severe complications and death.

Malaria remains a **preventable cause of serious illness and death worldwide**, including in the United States

3.2 billion people – almost half the world's population – are at risk

229 million people became ill from malaria in 2019 across 87 countries

409,000 people died from malaria in 2019

\$12 billion lost per year in economic productivity in Africa alone

Malaria is still a threat to American travelers, military personnel, and citizens living and working abroad. Typically, about **2,000 malaria cases are diagnosed** each year in the United States.

DEMONSTRATED SUCCESS

Malaria's toll would be much higher without the efforts of the U.S. Government, including CDC, and other global partners.

With the massive scale-up of malaria prevention and treatment interventions:

Globally, almost 7.6 million lives were saved since 2000

Malaria deaths in Africa were reduced by 44% between 2000 and 2019

CDC's EFFORTS

CDC provides scientific leadership and innovation to fight malaria, working hand in hand with Ministries of Health, other U.S. Government agencies, and partners.

Providing scientific leadership and technical assistance to guide countries and partners

Improving data quality and accessibility for use in decision-making

Scaling up interventions through the U.S. President's Malaria Initiative (PMI)

Conducting innovative research to improve diagnostics, antimalarial drugs, vaccines, and tools to control mosquitoes

Preventing, treating, and tracking malaria in the United States

SPOTLIGHT ON KEY CDC ACTIVITIES

Serves as a World Health Organization (WHO) Collaborating Center for Prevention and Control of Malaria and participates on advisory and technical working groups to inform and improve global programs

Tracks reported malaria cases to prevent re-introduction to the United States, provides guidance to travelers, and advises physicians on prevention, diagnosis, and treatment

Co-implements PMI with U.S. Agency for International Development (USAID) and advises on surveillance, monitoring and evaluation, and research

Assesses pilot implementation of a new malaria vaccine (RTS,S) in western Kenya

Operates a state-of-the-art insectary to help understand mosquito behavior and how to control the spread of malaria, and tracks distribution of insecticide resistance

Supports development of diagnostic tools, builds capacity of states and countries to diagnose malaria, and evaluates malaria rapid diagnostic tests from various manufacturers for compliance with standards, preferred practices for labeling, and instructions for use

Provides technical leadership to help eliminate malaria in Haiti and the Dominican Republic through Malaria Zero, to create a malaria-free zone across the Caribbean

WHAT'S NEEDED?

Enhanced efforts to prevent malaria in travelers and ensuring timely diagnosis and treatment of all cases of malaria in the United States

Continued scale-up in countries hardest hit by malaria, with insecticide-treated nets, indoor spraying, effective diagnostics and treatment, and prevention in pregnant women

Improved surveillance systems to monitor progress and targeting interventions to where they are most needed and evaluate impact

Monitoring and mitigating of threats from insecticide and drug resistance

Evaluation of new vaccines, diagnostic case management, and vector control tools

Targeted strategies to reduce and interrupt transmission to achieve elimination
