What Parents Need to Know About Marijuana Use and Teens

Fast Facts

- 38% of high school students report having used marijuana in their life.¹

- Research shows that marijuana use can have permanent effects on the developing brain when use begins in adolescence, especially with regular or heavy use.²

- Frequent or long-term marijuana use is linked to school dropout and lower educational achievement.³

Negative effects on school and social life

Marijuana use in adolescence or early adulthood can have a serious impact on a teen’s life.

- **Decline in school performance.** Students who smoke marijuana may get lower grades and may more likely to drop out of high school than their peers who do not use.⁴

- **Increased risk of mental health issues.** Marijuana use has been linked to a range of mental health problems in teens such as depression or anxiety.⁵ Psychosis has also been seen in teens at higher risk like those with a family history.⁶

- **Impaired driving.** Driving while impaired by any substance, including marijuana, is dangerous. Marijuana negatively affects a number of skills required for safe driving, such as reaction time, coordination, and concentration.⁷,⁸

- **Potential for addiction.** Research shows that about 1 in 6 teens who repeatedly use marijuana can become addicted, which means that they may make unsuccessful efforts to quit using marijuana or may give up important activities with friends and family in favor of using marijuana.

Marijuana and the teen brain

Unlike adults, the teen brain is actively developing and often will not be fully developed until the mid 20s. Marijuana use during this period may harm the developing teen brain.

**Negative effects include:**

- Difficulty thinking and problem solving.
- Problems with memory and learning.
- Impaired coordination.
- Difficulty maintaining attention.³

The teen years are a time of rapid growth, exploration, and onset of risk taking. Taking risks with new behaviors provides kids and teens the opportunity to test their skills and abilities and discover who they are. But, some risk behaviors—such as using marijuana—can have harmful and long-lasting effects on a teen’s health and well-being.
The term “addiction” is used to describe compulsive drug seeking despite negative consequences. However, we recognize that “addiction” is not considered a specific diagnosis in the fifth edition of The Diagnostic and Statistical Manual of Mental Disorders (DSM-5)—a diagnostic manual used by clinicians that contains descriptions and symptoms of all mental disorders classified by the American Psychiatric Association (APA). Rather the DSM-5 uses the term substance use disorder. However, throughout this document addiction is used synonymously with having a substance use disorder for ease of language recognition and understanding.
