The rapid spread of Zika virus across the World Health Organization’s Region of the Americas has had a direct effect on the U.S. health care delivery system. Hospitals in New York City (NYC) have been implementing prevention and response efforts consistent with CDC guidance. As of September 21, 2016, a total of 715 cases of laboratory-confirmed Zika virus disease had been diagnosed in New York state among travelers who returned from affected areas, their sexual contacts, or infants infected in utero. This represents the highest number of reported cases in any state to date, and underscores the importance of health care systems preparing to care for patients with possible Zika virus disease (1). Building upon a framework that was established in 2014 to screen patients for possible exposure to Ebola virus disease (Ebola), NYC Health + Hospitals, the largest municipal health care delivery system in the United States, implemented a Zika Preparedness and Response Action Plan (Zika Action Plan) to address the threat from Zika and ensure appropriate patient care. The plan developed by NYC Health + Hospitals includes universal travel screening, signage depicting areas with active Zika virus transmission, clinical and epidemiologic evaluation for possible Zika virus exposure, diagnostic testing for Zika virus infection and linking of infected patients to appropriate specialists, and education on Zika virus disease and preventive measures (e.g., avoiding travel to areas with active Zika virus transmission).

NYC Health + Hospitals operates an integrated health care system that includes 11 acute care hospitals, six of which are regional trauma centers, six long-term care centers, numerous community-based health centers, a correctional health services unit, and a home care agency. The 42,000 staff members of NYC Health + Hospitals serve a population of approximately 1.2 million; the obstetrical units perform >18,000 deliveries each year. To prepare for and manage the Zika virus threat, NYC Health + Hospitals built its Zika Action Plan from a framework established during the 2014 Ebola outbreak. The Zika Action Plan is closely coordinated internally with its integrated system of hospitals and externally with the New York City Department of Health and Mental Hygiene (DOHMH) and the New York State Department of Health. Existing general protocols, such as universal screening for recent travel and exposure to communicable diseases, were augmented to include surveillance information about areas with local transmission of Zika virus to enhance early recognition and management of persons with Zika virus infection. The Zika Action Plan, which details the criteria for testing and reporting of Zika virus disease, includes Zika virus screening algorithms for pregnant and nonpregnant females, adult males, children, and newborns, and is based on guidance from CDC and DOHMH practices. Objectives of the Zika Action Plan include rapidly identifying patients at risk for Zika virus infection, offering testing, and providing all necessary care and counseling to persons with confirmed or probable Zika virus infection (2–4). The Zika Action Plan has been distributed across the NYC Health + Hospitals system of hospitals and ambulatory care centers and placed on the system’s internal intranet site for easy access.

Initial screening for possible Zika virus infection at all points of entry into NYC Health + Hospitals emergency departments, ambulatory units, and obstetrical settings includes signage that depicts areas with active Zika virus transmission. The signage is continually updated based on CDC guidance, and as new countries are added to the list of those with active transmission. A Zika-specific job aid (Figure 1) prompts personnel at the point of entry with a set of initial screening questions regarding travel history of the patient and the patient’s sexual contacts and any signs or symptoms compatible with Zika virus disease. Although local mosquito-borne transmission of Zika virus has not been documented, NYC Health + Hospitals personnel are encouraged to be vigilant for patients with Zika-compatible symptoms even in the absence of travel or sexual exposure risk (5). The Zika-specific job aid also references the NYC Health + Hospitals Zika Virus Pregnancy Screening Protocol (Figure 2). If a patient is pregnant, the greeter is prompted to refer her to the pregnancy screening protocol immediately for next steps.

The Zika Action Plan instructs clinicians to test for Zika virus disease after identifying a patient meeting the CDC case definition for suspected Zika virus disease (6). Information is solicited about travel to an area with ongoing Zika virus transmission or sexual contact with a person who traveled from such an area; receipt of blood, blood products, or an organ transplant within 30 days of symptom onset; and other potential epidemiologic links to a confirmed or probable case of Zika virus disease, including suspected mosquito-borne transmission and

---

† The Zika Action Plan is based on guidance from CDC, the New York City Department of Health and Mental Hygiene, and the New York State Department of Health.

A person with one or more signs/symptoms of fever, maculopapular rash, arthralgia, conjunctivitis, complication of pregnancy, or Guillain-Barré syndrome not known to be associated with another diagnosed etiology.

**Zika Outbreak Areas**<br><br>http://www.cdc.gov/zika/geo/active-countries.html

**Case Definition: Compatible Zika**

- **Symptoms:** fever >100.4°F/38°C, rash, joint pain, <br>e/- conjunctivitis (red eyes), arthralgia<br>http://www.cdc.gov/zika/symptoms/index.html

**Criteria for Testing:**

1. Pregnant women who (a) traveled while pregnant to an area with Zika transmission or (b) had unprotected sex (vaginal, anal, or oral) with a partner who spent time in an area with Zika transmission
2. Persons who developed compatible symptoms during or within 4 weeks of travel to an area with Zika transmission
3. Neonates with suspected or confirmed microcephaly or intracranial calcifications born to women who (a) traveled to an area with Zika virus transmission while pregnant or (b) had unprotected sex (vaginal, anal, or oral) during pregnancy with a partner who spent time in an area with Zika transmission
4. Anyone who developed Guillain-Barre syndrome after spending time in an area with active Zika virus transmission
5. *Other special conditions with epidemiological linkage to a confirmed or probable case of Zika virus infection including (a) recipient of blood, blood products, or organ transplant, or (b) suspected transfusion-association transmission, or (c) suspected mosquito-borne transmission, or (d) any other unusual clinical manifestation or suspected route of exposure

**Call to NYCDOH**

Be prepared to provide patient demographic information, travel and symptom information (e.g., dates and locations of travel, date of symptom onset), submitter information (i.e., your facility’s lab and laboratory director), ordering provider information (Chief of Service)

**When providing information to the DOH representative, indicate your facility’s Lab as the Submitter and provide the contact information of your Lab Director. The "Ordering Provider" is your Chief of Service

**Specimen Collection**

Specimens must be labeled with patient’s first and last name, date of birth, and date and time of collection

**NYC Health + Hospitals Central Office**

Point of Contact<br><br>Notify (contact information)
FIGURE 2. Zika-specific job aid that references Zika virus pregnancy screening protocol — NYC Health + Hospitals, 2016

**Zika Virus Pregnancy Screening**

**PROCESS STEP**

While pregnant or immediately prior to current pregnancy, have you (a) spent time in an area with Zika transmission OR (b) had sexual contact w/ a person who spent time in an area with Zika transmission anytime during the pregnancy?

*Consider Zika even in the absence of travel or sexual exposure risk*

**NOTES**

- **Zika Outbreak Areas**

- **Call to NYCDOH**
  - Call NYCDOH 866-692-3641 to discuss case and request testing

- **CDC Q&A for Pregnant Women**

- **NYC Health + Hospitals Central Office Point of Contact**
  - Notify (contact information)

**YES**

Test for Zika virus infection (regardless of symptoms) — Acute testing includes 2 tubes of serum and one specimen of urine

- **Positive or inconclusive for Zika virus infection**
  - - Serial fetal ultrasounds
  - - Counseling
  - - Referral to MFM
  - - Her partner should also be screened for Zika exposure (consult NYCDOH)

- **Equivocal or Presumptive positive IgM may require further testing. Check with DOH.**

**NO**

**END PROTOCOL**

- **Negative for Zika virus infection**
  - Perform fetal ultrasound to detect abnormalities consistent with Zika virus disease

- **Fetal abnormalities consistent with Zika virus disease present**
  - Retest pregnant woman for Zika virus infection

- **Fetal abnormalities consistent with Zika virus disease not present**
  - Routine prenatal care
Summary

What is already known about this topic?
The state of New York has reported the highest number of Zika virus cases in the continental United States, with 715 cases reported as of September 21, 2016, underscoring the importance of the health care system to be prepared to care for patients with possible Zika virus disease.

What is added by this report?
NYC Health + Hospitals created a Zika Preparedness and Response Action Plan by building upon the framework established in 2014 to screen patients for possible exposure to Ebola virus disease. The Zika plan includes universal screening for travel-associated Zika virus exposure, signage and maps depicting areas with active Zika virus transmission, laboratory services, and timely linking of infected patients to appropriate care.

What are the implications for public health practice?
A robust emergency preparedness and response program can help health care systems limit the effects of Zika virus and ensure appropriate screening, diagnosis, and care. Potentially effective strategies include modification of established and tested protocols, offering ongoing health care provider education, and close collaboration with state and local health departments for Zika guidance and support.

by NYC Health + Hospitals, Emergency Management, and questions are answered within 24 hours by clinical leaders. To assess staff competency and appropriate screening and identification of suspected cases of Zika virus infection, NYC Health + Hospitals, Simulation Center and Emergency Management is conducting a series of no-notice simulation exercises at each of the system's prenatal clinics. Scenarios include a pregnant woman and accompanying partner with Zika-compatible risk factors. The goal of these exercises is to assess each clinic's ability to screen for, identify, offer testing for, and provide education on Zika virus infection, including modes of transmission and ways to prevent the spread of Zika virus, and then provide corrective actions as necessary when deficiencies are identified (e.g., directing the prenatal clinic leadership to the NYC Health + Hospitals Zika intranet page for the most up-to-date Zika guidance and information).

During April–July 2016, a total of 729 patients from NYC Health + Hospitals were tested for possible Zika virus infection.** Testing for Zika virus infection increased substantially over the 4-month period, with 29 tests in April, 69 in May, 314 in June, and 317 in July. Since mid-July, NYC Health + Hospitals has been sending specimens from nonpregnant persons with noncritical, travel-related cases of potential Zika virus infection to a commercial laboratory for testing. All other specimens for Zika virus testing are sent to DOHMH.

As the number of laboratory-confirmed Zika virus disease cases continues to rise, health care systems should be vigilant and prepared to address this public health concern. Close collaboration with state and city health departments will play a critical role. The program implemented by NYC Health + Hospitals can serve as a guide for other health care systems to screen patients and offer Zika virus testing, and to link patients with laboratory-confirmed infection to appropriate care.
